USE AND MAINTENANCE MANUAL

TX500M

TX500S

TECHNICAL ANNEX

Cte broadcast

Via Sevardi, 7 - 42010 Mancasale Reggio Emilia (Italy)
Tel. (+39) 522 50 94 50 - Fax (+39) 522 50 94 48
E-Mail: broad.com@cte.it
Web site <http://www.cte.it>

1st Edition
Rev. 2 - 10/09/2001
Cod. MAN0071

Dear User,

Firstly, thank you for choosing a  Cte broadcast product.

Great care has been taken during the design of the protection circuitry to ensure compatibility with products from other manufacturers. However the best performance is achieved when the equipment is used with other products manufactured by  Cte broadcast.

The unit has been designed to guarantee consistent performance over time, without the need for special maintenance. The need for this is minimised by regular functional checks of those components which are ventilated.

Operation of the unit is very easy and intuitive. Even so it is recommended that this manual and other relevant documentation is read carefully before any operation is attempted.

Customer Care

7. TECHNICAL SPECIFICATION

Page 113

Page numbers marked with an asterisk (*) are in A3 format

1.1. Front view

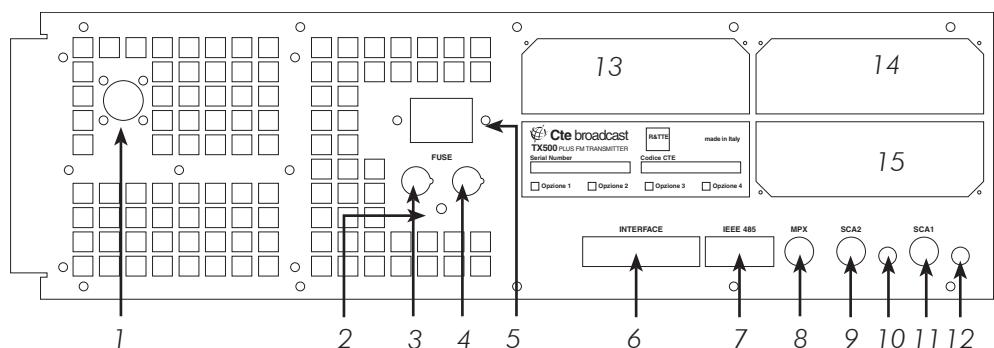

1.1.1. Front Panel description

- 1) Power on switch
- 2) Switches for programming operation
- 3) Led: "ON AIR" lit, indicates the PLL has reached the desired frequency
"FAULT" lit, indicates the output power is below the preset threshold
"MAINS" lit, indicates the unit is switched on
- 4) The "RF monitor" connector provides an RF monitor signal
- 5) The "MPX OUT" connector provides an audio signal
- 6) Display

N.B.

Do not obstruct the ventilation grills

1.2.
Rear view

 1.2.1.
Rear Panel description

- 1) "RF OUT" connector
- 2) Earthing terminal
- 3-4) Power supply fuse (10A)
- 5) Line supply socket
- 6) Analog signal interface
- 7) Telemetry interface
- 8) "MPX" input connector
- 9) "SCA2" input connector
- 10) Trimmer for calibrating the "SCA2" input
- 11) "SCA1" input connector
- 12) Trimmer for calibrating the "SCA1" input
- 13) Slot for inserting the RDS board
- 14) Slot for inserting the stereo inputs board
- 15) Slot for inserting the stereo encoder board

N.B.

Do not obstruct the ventilation grills

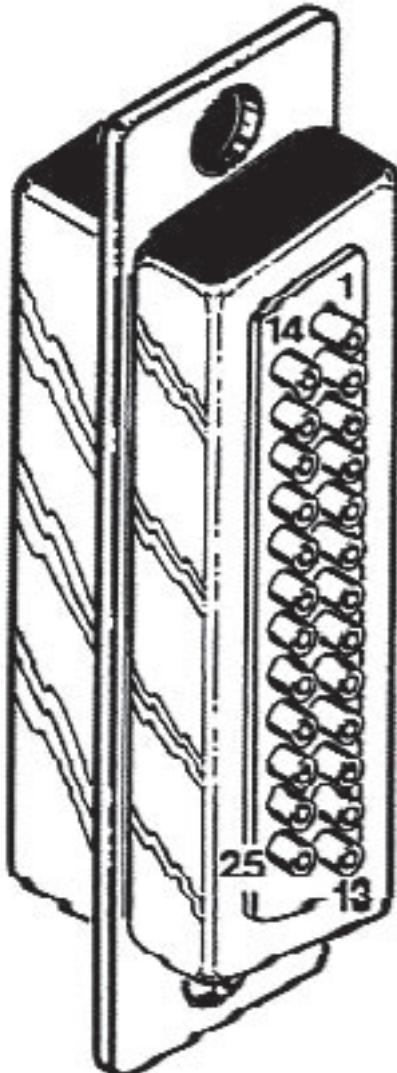

2. Installation

Remove the unit from its packaging and before attempting any operation, check that the unit has not been damaged during transport and that all the switches and connectors located on the front and rear panels are serviceable.

- ☞ Install the unit so that it is accessible from all sides
- ☞ Ensure that the location of the unit allows for connection to an efficient earthing point
- ☞ Ensure that the antenna system is suitable
- ☞ Check that any amplifier to be eventually connected downstream is connected to the antenna system
- ☞ Connect the appropriate inputs of the exciter according to the type of operation required:
 - ☞ the monophonic signal to the XLR connector on the mono board
 - ☞ the stereo signal (low frequency) to the left and right XLR connectors on the stereo input board
 - ☞ the stereo signal (wide-band) to the MPX connector on the MPX and SCA inputs board
 - ☞ the RDS signal to one of the two SCA connectors on the MPX and SCA inputs board
 - ☞ If the RDS board is fitted, the wide-band stereo signal goes directly to the MPX inputs on the RDS board, so the MPX+RDS output will be connected to the MPX input on the MPX and SCA inputs board.
- ☞ Connect the electricity supply cable
- ☞ Connect the RF output to the input of any amplifier to be used, or to the antenna system
- ☞ Switch on the amplifier (if present)
- ☞ In order to verify that the equipment is functioning correctly, check the values displayed by the exciter and amplifier displays and instrumentation

- 3.1. User interface** The user interface is designed to accept up to 14 analog signals in the range 0 to 2V. For example, it is possible to read a remote temperature, remote voltages and currents of other equipment and direct and reflected power of other equipment.

Pins with an "NC" prefix are not connected
Pins with a "GND" prefix are earths

3.2. Telemetry Connection and operation

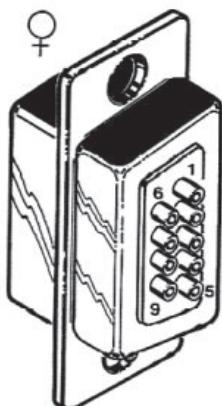

The TX500's telemetry feature allows an IBM compatible PC to be connected directly to the unit, or via a GSM modem. The main operational parameters can be displayed and modified via telemetry using the Hyper Terminal software supplied with any version of Microsoft Windows (c).

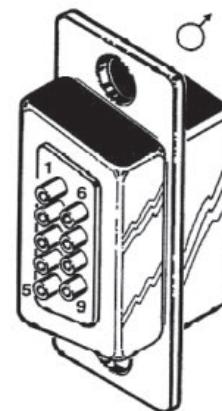

Connect the unit to a GSM modem, or directly to a PC, using the cable supplied (see diagram below).

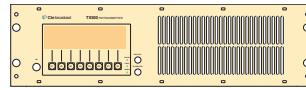

TX500 -----> PC

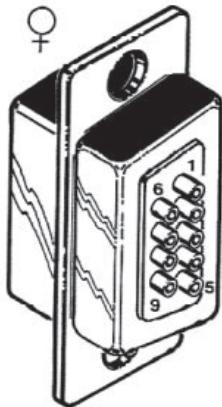

1 DCD	DCD 1
2 RxD	RxD 2
3 TxD	TxD 3
4 DTR	DTR 4
5 GND	GND 5
6 DSR	DSR 6
7 RTS	RTS 7
8 CTS	CTS 8
9 RI	RI 9

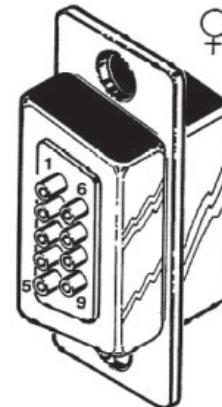

DB9 Male - DB9 Female

TX500 -----> Modem

1 DCD	DCD 1
2 RxD	RxD 2
3 TxD	TxD 3
4 DTR	DTR 4
5 GND	GND 5
6 DSR	DSR 6
7 RTS	RTS 7
8 CTS	CTS 8
9 RI	RI 9

DB9 Male - DB9 Male

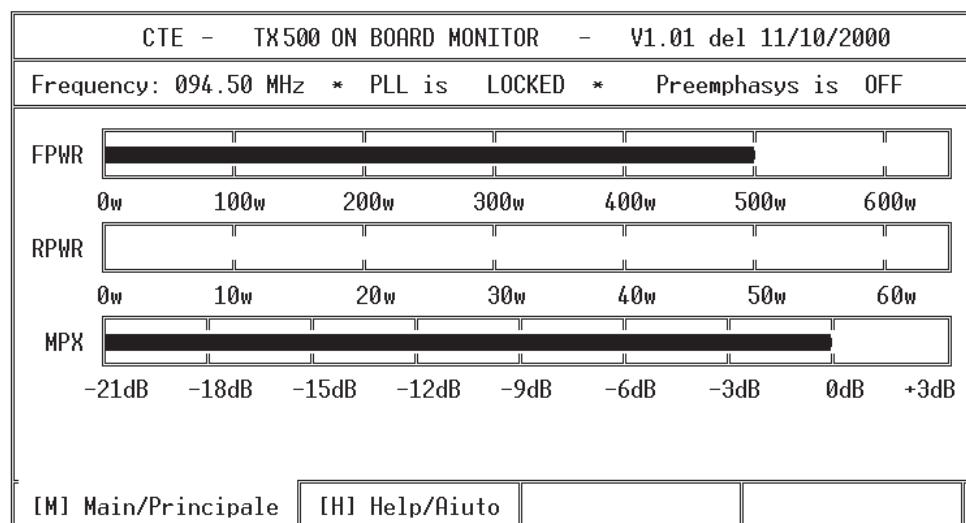

Run the Hyper Terminal software supplied with Microsoft Windows.

Enable the connection (to connect via modem, refer to the configuration in the GSM modem manual).

Telemetry will now be available on the PC, but to transfer data, the code \$1111 must be entered; only then may the unit's parameters be displayed and modified.

3.2.
Telemetry
Connection
and operation

Main Screen

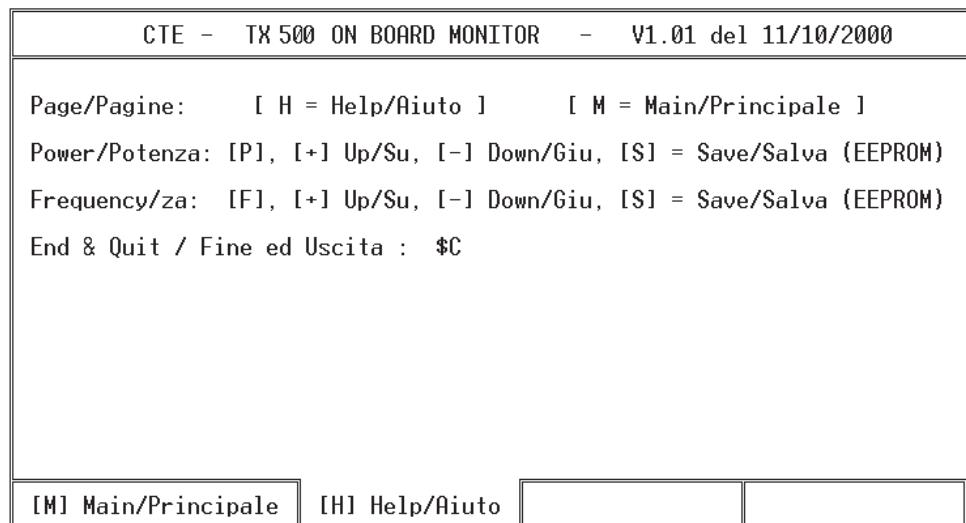

The following parameters can be viewed on the main screen: the programmed frequency, the status of the PLL, the status of pre-emphasis, the level of direct power, the level of reflected power and the audio level.

From this screen the output power can be increased or decreased by pressing the "P" key with either the "+" or "-" keys respectively. Once the desired value has been reached, it can be saved by pressing the "S" key.

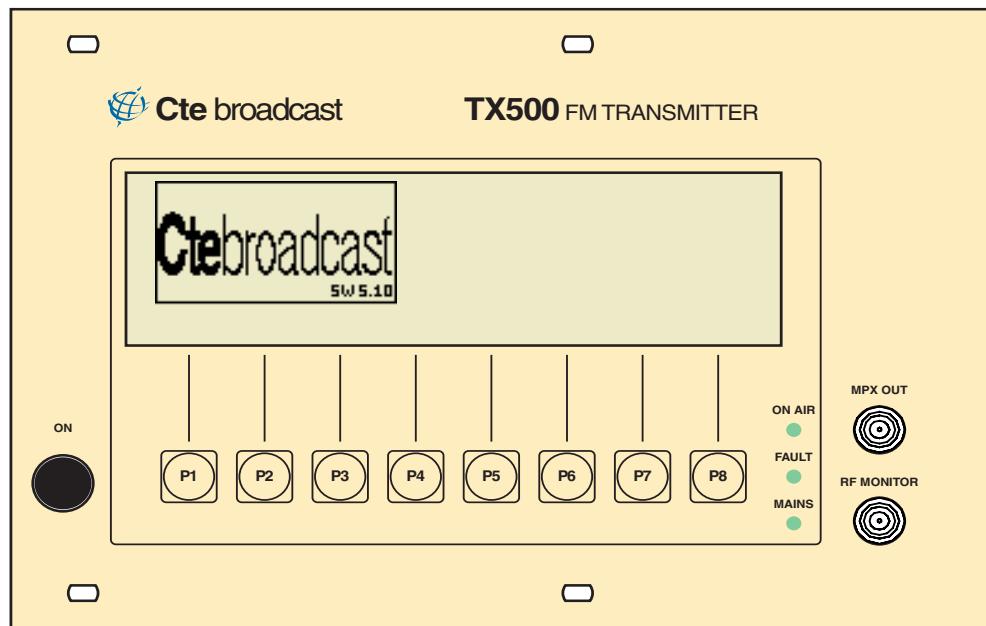

To modify the frequency, press the "F" key with either the "+" or "-" keys to increase or decrease the frequency respectively. Once the desired frequency has been reached, it can be saved by pressing the "S" key.

To terminate transmission of data, type "\$C".

Pressing the "H" (help) key will open the help screen where all the above commands are identified (see diagram below).

Press the "M" (Main) key to return to the main screen.

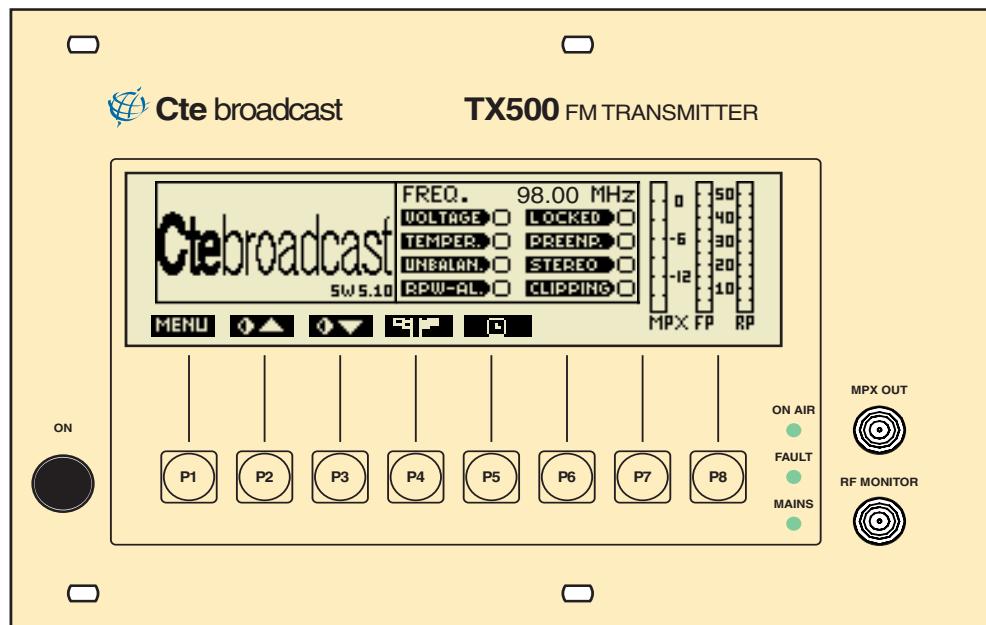

3.3.
 Powering up

- ➡ The start up screen appears showing the state of the audio BUS.
- ➡ The microprocessor runs a system check to verify which optional boards have been fitted.
- ➡ The countdown starts (duration 8 seconds) after which the exciter will develop power.

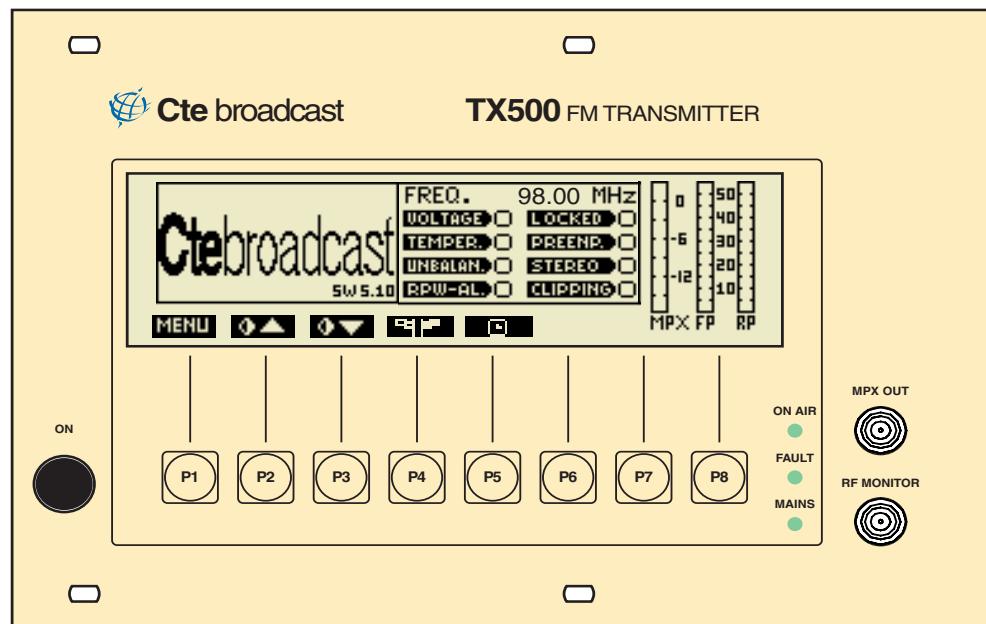

Pressing keys during the countdown:

- ➡ Pressing any key will prevent power from being developed
- ➡ Pressing F1 + F8 will terminate the countdown

On termination of the countdown, the main menu will appear (with the CTE logo or that of the customer)

3.4.1.
Main Menu

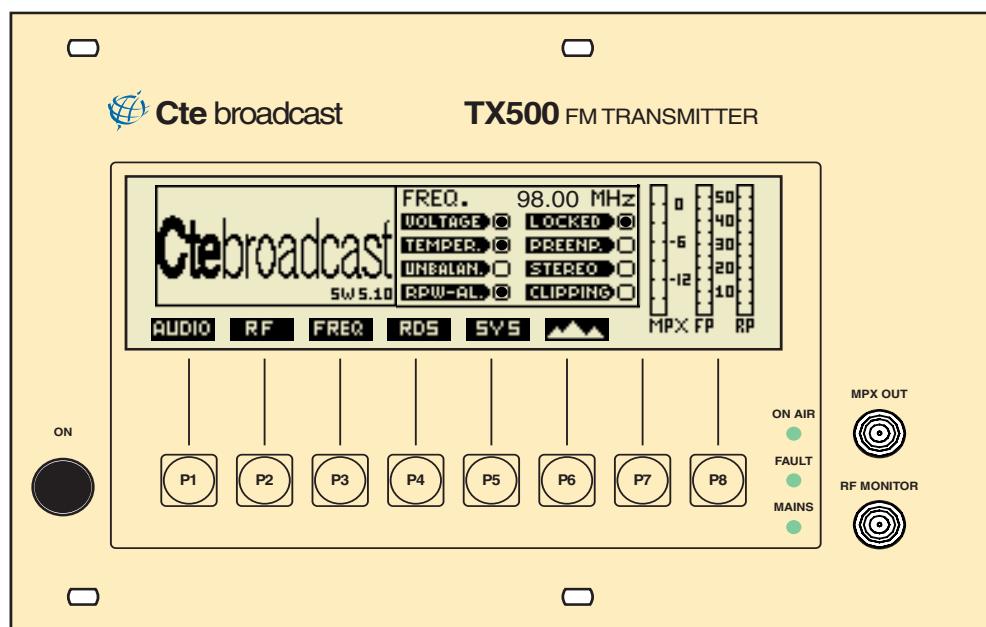

- ☞ Press key P1 to access the menu functions
- ☞ Press key P2 to increase the contrast of the display
- ☞ Press key P3 to reduce the contrast of the display
- ☞ Press key P4 repetitively to select the desired language
 - The language of the display will change each time the key is pressed
 - The language selected will be indicated by a letter under the CTE logo.
- ☞ Press key P5 to display the time for which the unit has been operated.

The main menu displays respectively: MPX level, direct power, reflected power, operating frequency, PLL lock, clipper operation, insertion of pre-emphasis and insertion of the stereo encoder.

The logo displayed by the unit can be personalised on the request of the user. The default logo is that of CTE with which is also displayed the version of software installed (e.g. V4.08) and the language selected (e.g. UK)

3.4.2. Functions Menu

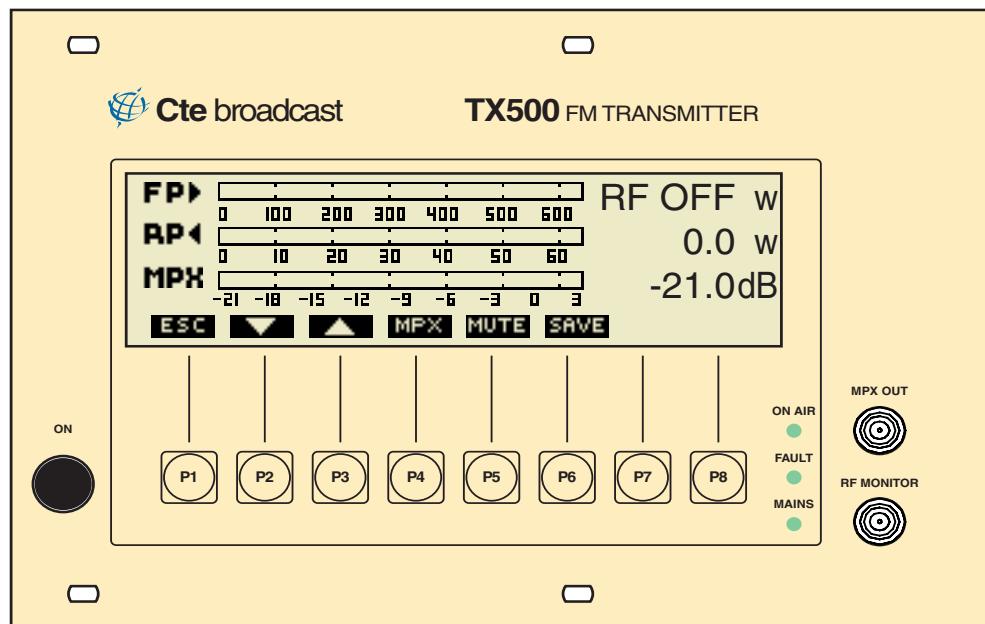

- ☞ Press key P1 to access the audio menu
- ☞ Press key P2 to access the RF menu
- ☞ Press key P3 to access the frequency programming menu
- ☞ Press key P4 to access the RDS menu if the optional RDS board is fitted
- ☞ Press key P5 to access the user setup menu
- ☞ Press key P6 to access the deviation and statistics menu

The following parameters are displayed in the Functions menu: MPX level, direct power, reflected power, operating frequency, PLL lock, clipper operation, insertion of pre-emphasis and activation of the stereo encoder.

Once the functions menu has been entered, if no key is pressed, the main menu will automatically appear after 10 seconds.

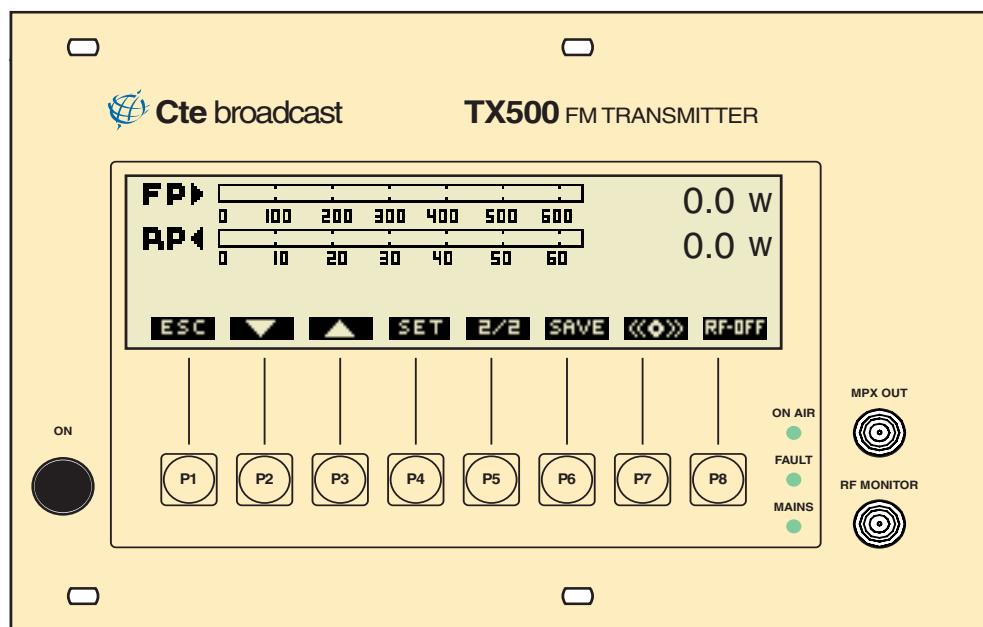

3.4.3. **Adjustment of the input signal level**
Audio Menu

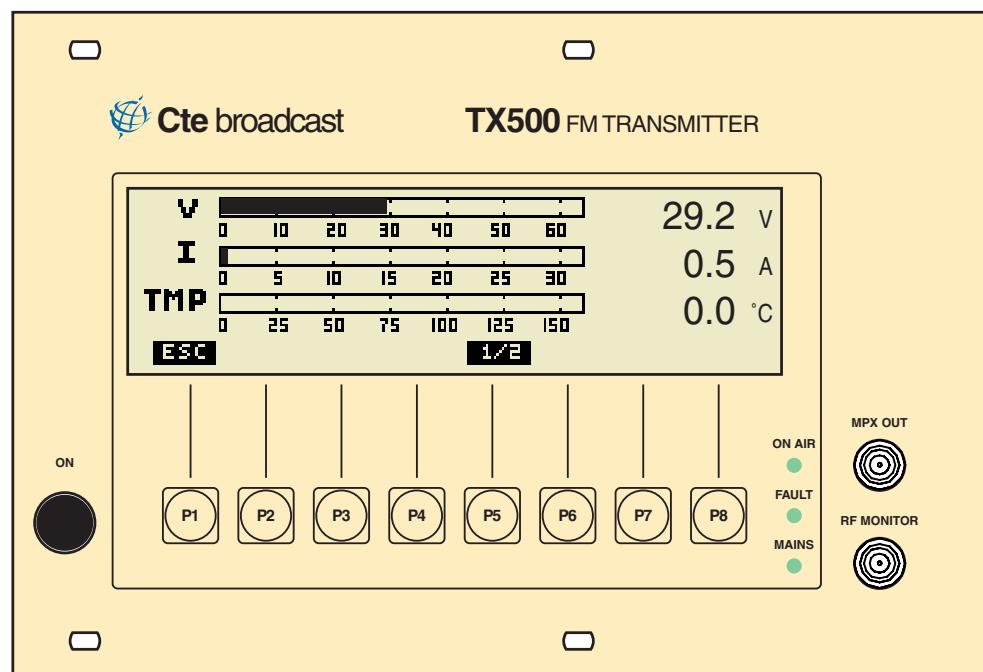

- ☞ Press key P1 to return to the functions menu
- ☞ Press key P4 to set the input signal level (default 0dBm)
- ☞ Press key P2 to reduce the input signal level
- ☞ Press key P3 to increase the input signal level
- ☞ Press key P6 to save the adjustment made
- ☞ Press key P5 to disable or re-enable the audio signal

The audio menu displays the following parameters: direct power, reflected power and MPX signal level in both "analog" and numerical form. In the diagram direct power is disabled (RF OFF), the reflected power is 0W and the MPX signal level is -21dBm.

If the stereo encoder is present, the indication of direct and reflected power is replaced by the level of the signals on the left and right channels.

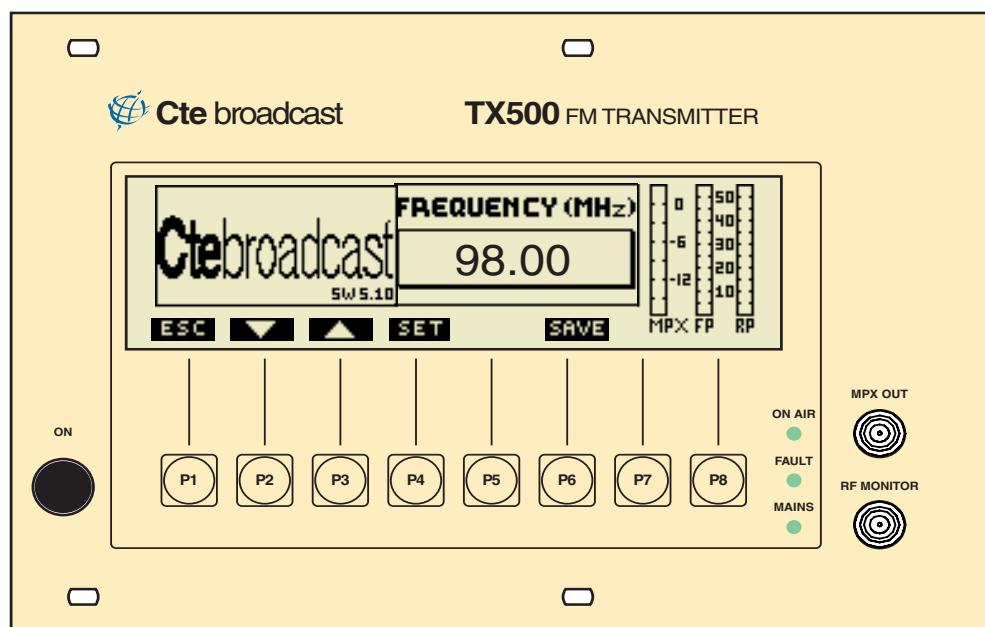

3.4.4.
 RF Menu

- ☞ Press key P1 to return to the functions menu
 - ☞ Press key P4 to set the output power level from 0W to a maximum value of 500W
 - ☞ Press key P2 to reduce the output power
 - ☞ Press key P3 to increase the output power
 - ☞ Press key P6 to save the adjustment made
 - ☞ Press key P5 to view the mask below
 - ☞ Press key P7 to set the reflected power alarm threshold
 - ☞ Press key P8 to activate or deactivate the output stage of the amplifier. For example, in the diagram, output power is disabled.
- In the RF menu, the following parameters are displayed: direct power, reflected power and MPX signal level in both "analog" and numerical form.

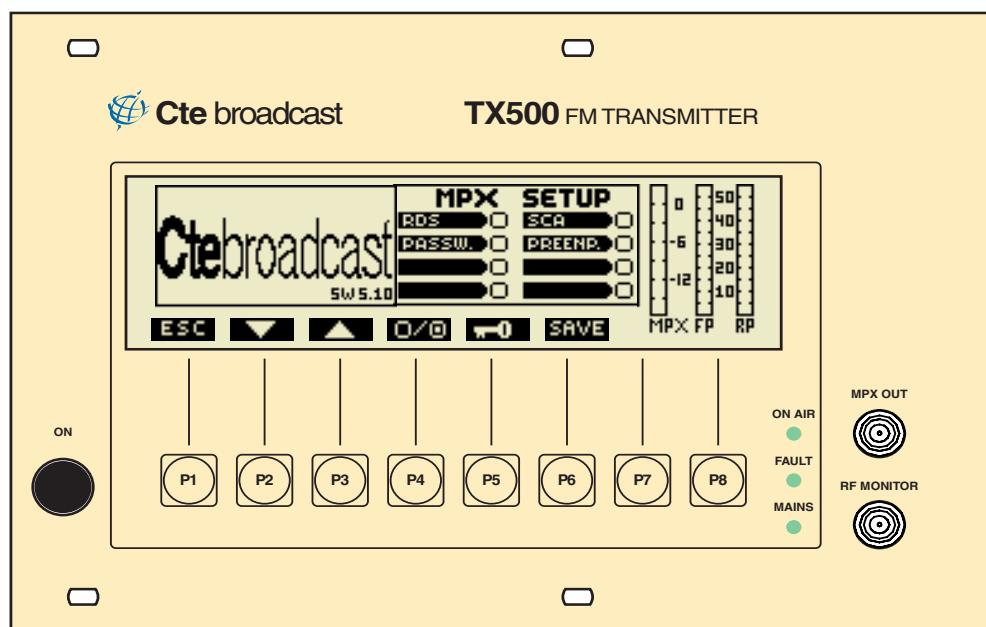

- ☞ Press key P1 to return to the functions menu
- ☞ Press key P5 to return to the previous mask (1/2)

3.4.5. Adjustment of output frequency
Frequency Menu

- ☞ Press key P1 to return to the functions menu
- ☞ Press key P4 to set the operating frequency
- ☞ Press key P2 to reduce the operating frequency
- ☞ Press key P3 to increase the operating frequency
- ☞ Press key P6 to save the adjustment made

3.4.6. User setup menu

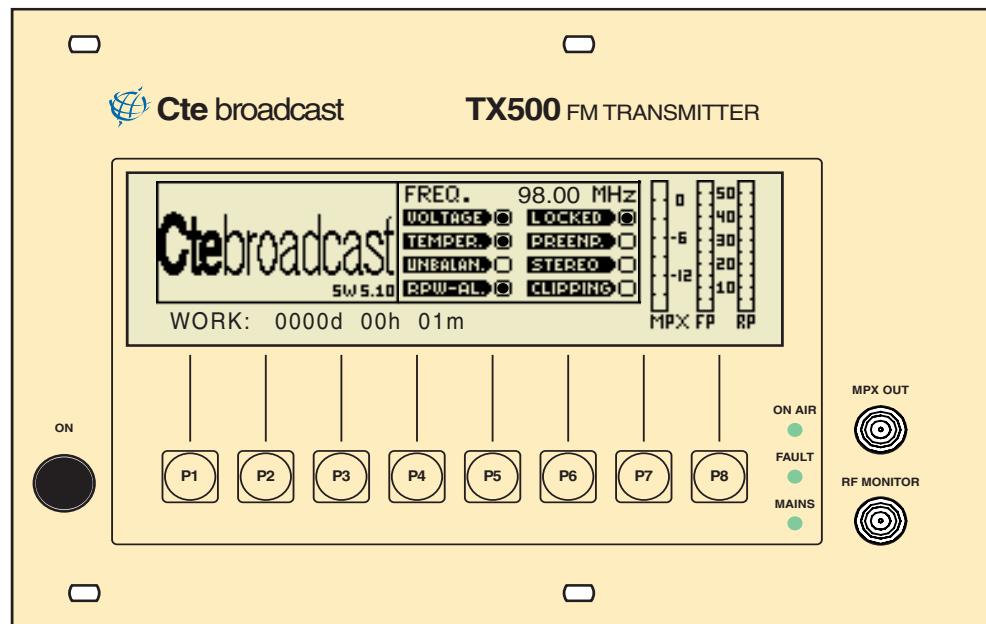

- ☞ Press key P1 to return to the functions menu
- ☞ Press key P2 to scroll the menu options from top to bottom
- ☞ Press key P3 to scroll the menu options from bottom to top
- ☞ Press key P4 to enable (circle filled) or disable (circle empty) the selected function
- ☞ Press key P6 to save the change
- ☞ Press key P5 to program a four figure password

The password restricts access to the audio, frequency, power and user setup menus by unauthorised personnel.

The following parameters are displayed in the user setup menu: MPX level, direct power, reflected power, clipper operation, insertion of pre-emphasis and activation of the stereo encoder.

3.4.7. Timer Display

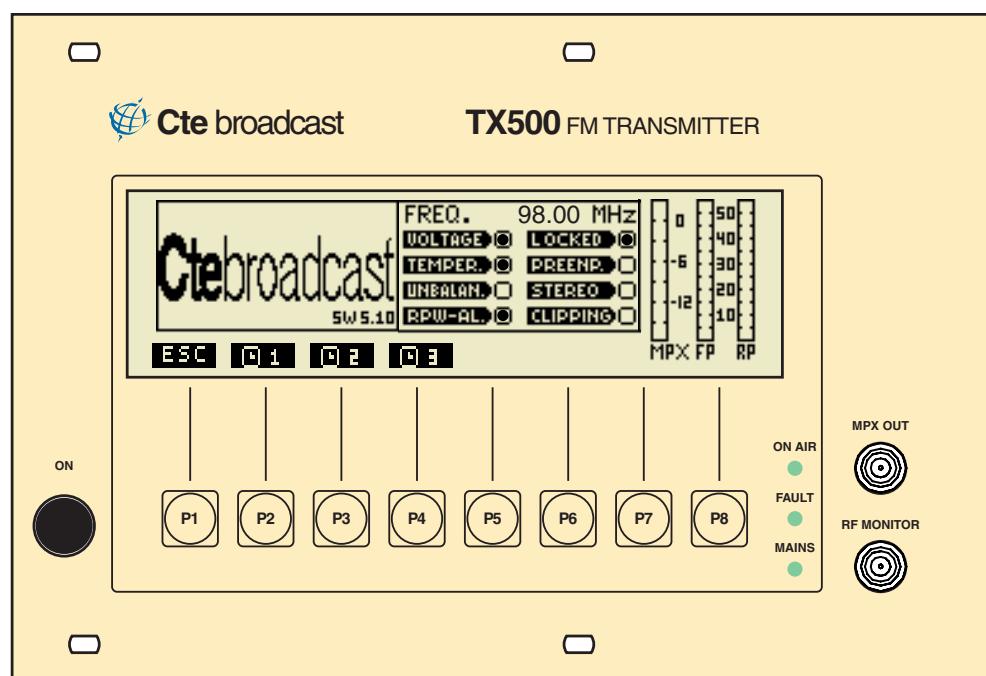

From the main menu, key P5 accesses the timer display which indicates the operating time of the unit in days (d), hours (h) and minutes (m); after about 3 seconds, it automatically returns to the main menu.

Hiring the device

>>

Pressing keys P5 and P8 at the same time for about 3 seconds, you can access the clock menu (see figure below) in which you can set the operating parameters of the device if hired to a third party (password and working lapse of time).

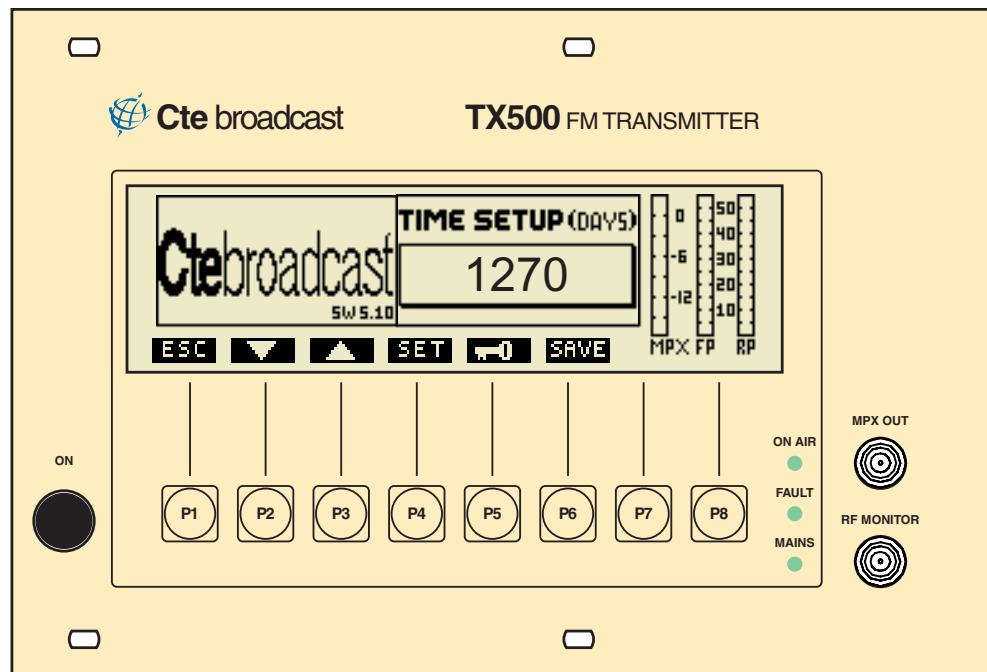

- ☞ Press key P1 to return to the function menu
- ☞ Press key P2 to access the clock menu number 1
- ☞ Press key P3 to access the clock menu number 2
- ☞ Press key P4 to access the clock menu number 3

You can set up to 3 different lapses of time each protected with its own password.

Hiring the device

>>

A DESCRIPTION OF THE TIMER FUNCTIONALITIES FOLLOWS (SEE FIGURE BELOW)

- ☞ Press key P1 to return to the previous menu
- ☞ Press key P4 to set the number of days after which the device will stop working
- ☞ Press keys P2 and P3 respectively to decrease or increase the number days (from 1 to 1000) see note 1.
- ☞ Press key P6 to save settings concerning the number of days. You must set a password to activate the above mentioned settings.
- ☞ Press key P5 to set a password. You must digit the password for a second time to activate it (see note 2).

The setted timer will start counting the days from the first time the device is restarted.
 Once expired the setted periode, you must digit the password to restore the correct working of the device.

It will work until another setted timer expires or indefinitely otherwise.

NOTE 1:

Accessing one of the timers for the first time, you will see the number of days the manufacturer sets as default, which is 1270 (this value means that the timer is not active).

Setting "0" as number of days and pressing key P6 to save, but not setting a password, the timer value will return to 1270 when the device is restarted for the first time (the timer is not active).

Setting "0" as number of days, pressing key P6 to save and setting a password, the device will stop working after about an hour or before, if restarted.

NOTE 2:

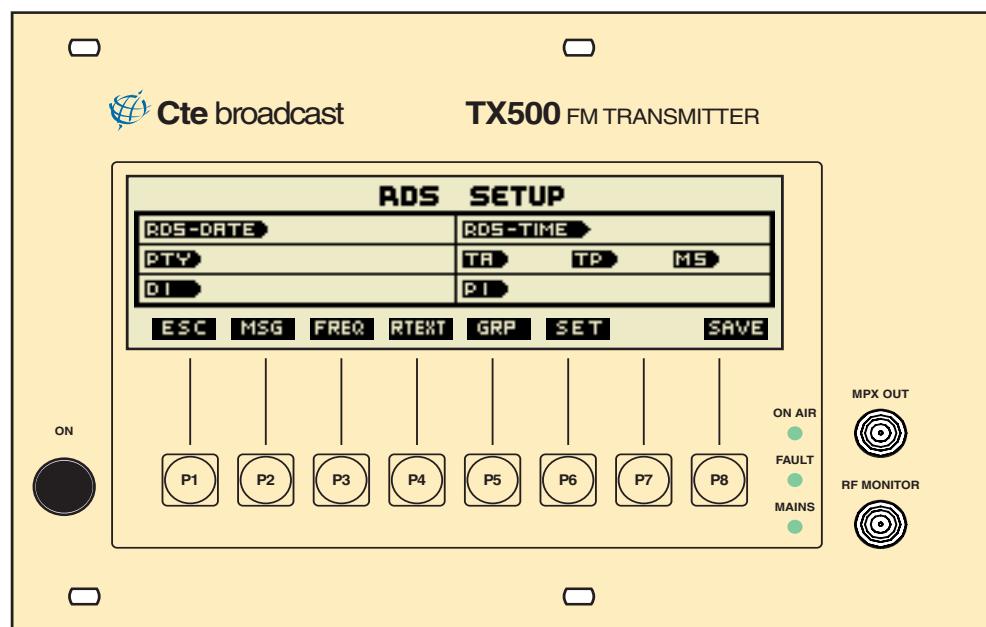

Once setted a password for a timer, this will be always the same unless it is modified using key P5.

To enter one of the clock menus protected with a password you must digit that password even if the timer is not active.

If you forget the setted password it is necessary to substitute the EEPROM; IT IS THUS ESSENTIAL TO REMEMBER IT!!!

3.4.8.
RDS menu
(Optional)

Adjustment of RDS settings (optional)

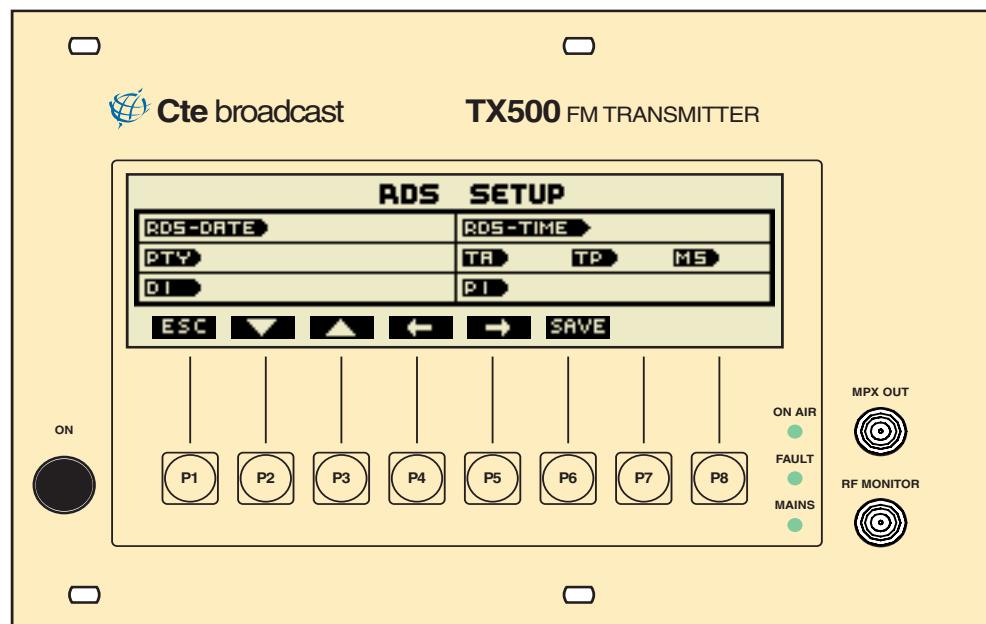

In function menu press P4 to enter RDS menu

- ☞ Press P1 to return to function menu
- ☞ Press P2 to enable RDS messaging settings
- ☞ Press P3 to enable alternative frequencies settings
- ☞ Press P4 to enable radio text settings
- ☞ Press P5 to enable groups settings
- ☞ Press P6 to set RDS Date and Time, PTY, DI, TA, TP, MS and PI
- ☞ Press P8 to save settings

3.4.8.
RDS Menu
(Optional)

From the RDS menu (par. 3.4.8.)
☞ Press key P6 to program RDS Date and Time, PTY, DI, TA, TP, MS and PI

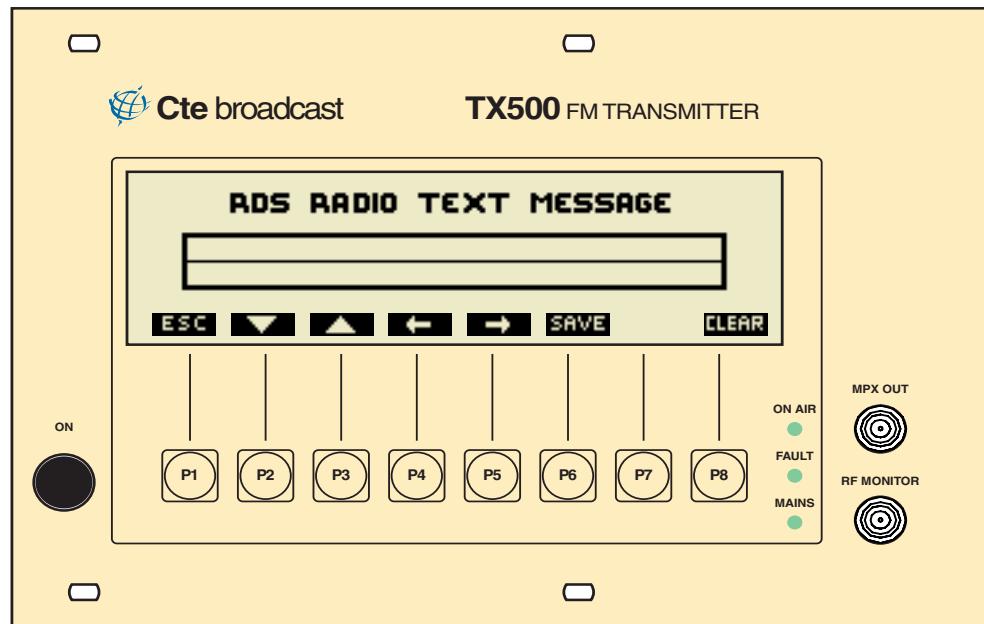

- ☞ Press key P1 to return to the main RDS menu
- ☞ Press keys P4 and P5 to select the data to modify
- ☞ Press keys P2 and P3 to select options for the selected data
- ☞ Press key P6 to save the changes made

3.4.8. RDS Menu (Optional)

From the RDS menu (par. 3.4.8.)

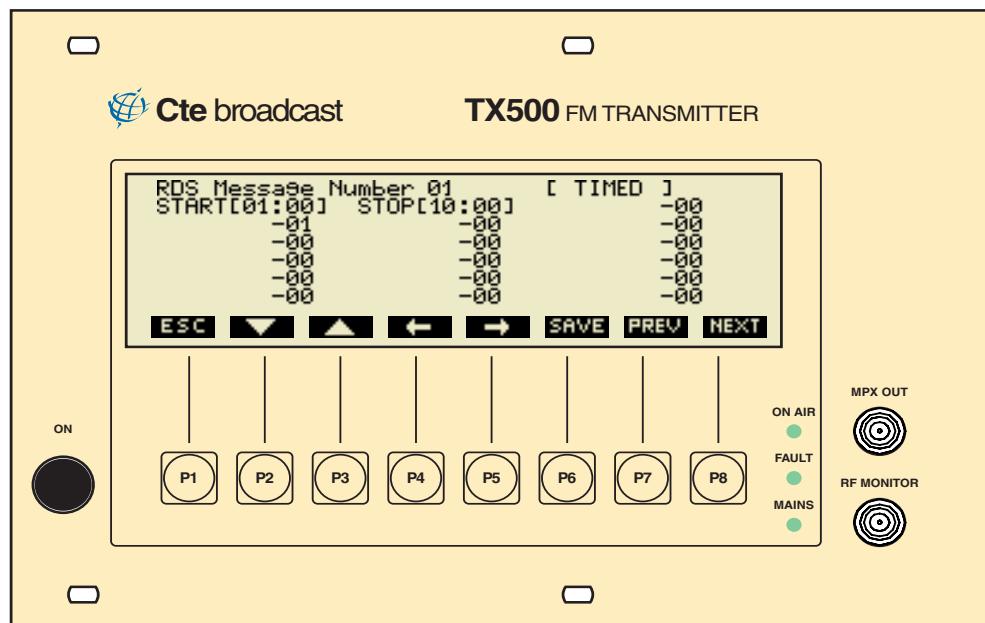

- ☞ Press key P4 to set the RDS TEXT message

- ☞ Press key P1 to return to the main RDS menu
- ☞ Press keys P4 and P5 move the cursor
- ☞ Press keys P2 and P3 to select the letter to insert
- ☞ Press key P6 to save the changes made to the message
N.B. If unsaved, the previous message will remain unchanged
- ☞ Press key P8 to delete the whole message

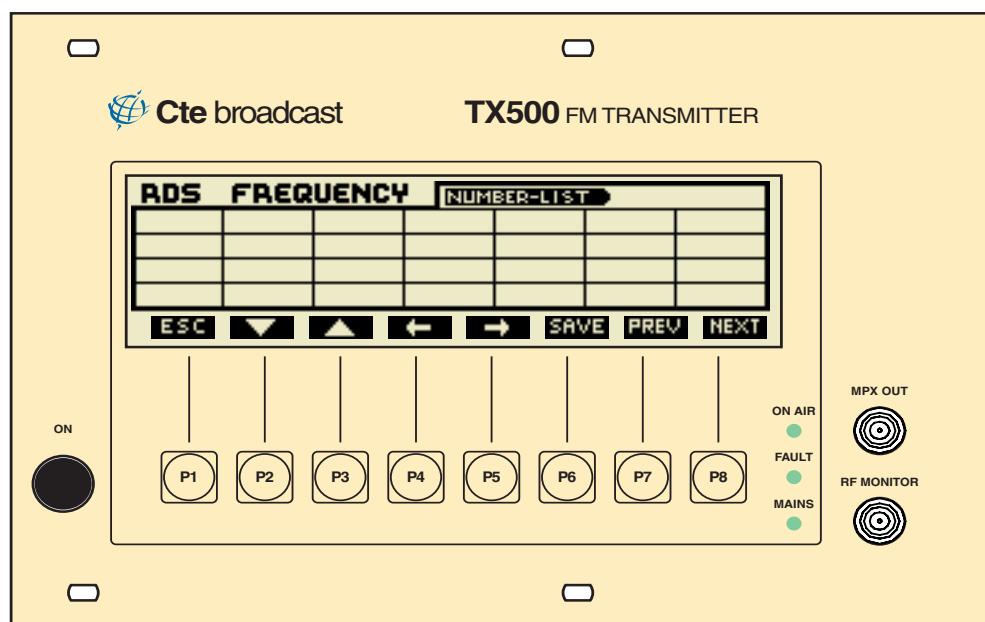

3.4.8.
RDS menu
(Optional)

From the RDS menu (par. 3.4.8.)
☞ Press key P2 to display the RDS messages

- ✓ Status display (Disable, Timed, Scroll)
- ✓ Display of START and END display time
- ✓ 16 fields comprising 8 characters each and display times in seconds

From the RDS menu (par. 3.4.8.)
☞ Press key P3 to set alternative frequencies

This window shows one of the sixteen lists of RDS frequencies.
The following is displayed in this window:

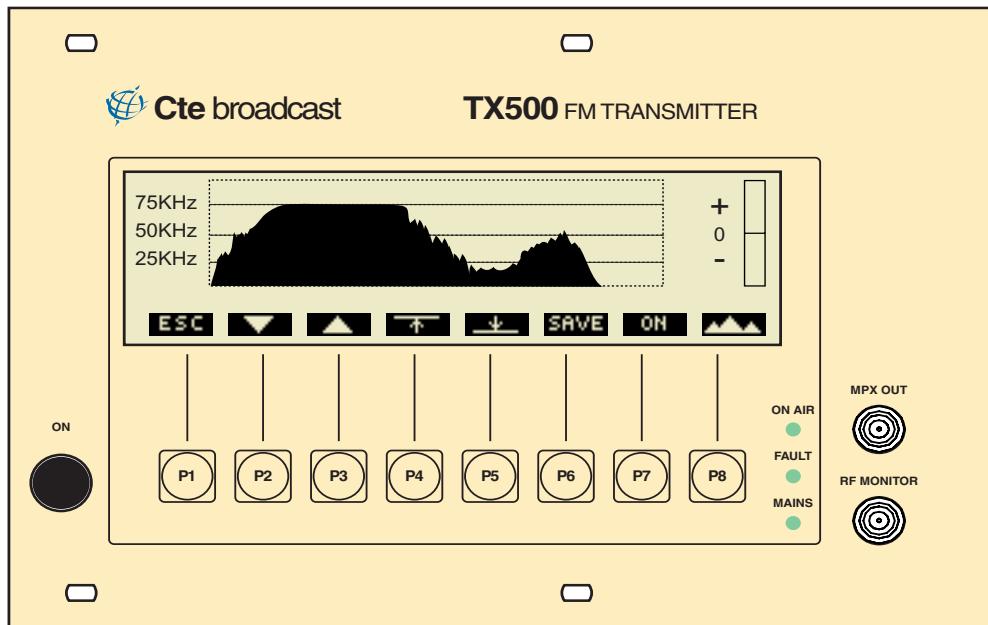

- ✓ Display of the list number
- ✓ Display of the type of list (A or B)
- ✓ Display of the list header (only for list type "B")
- ✓ 28 fields that can be filled with 24 frequencies of type "A" or 12 of type "B"

3.4.9. Deviation and Statistics Menu

- From the functions menu (par. 3.4.2.)
 ↗ Press key P6 to display Deviation and Statistics

In this menu it is possible to set the upper and lower limits of the composite signal MPX. For both the positive and negative thresholds, you can choose a value comprised between 0 dB / 9.9 dB and 0 / -9.9dB. The ALC circuit will maintain the deviation between the two chosen thresholds.

You can also set the ALC response delay time from a minimum of 0.1 seconds to a maximum of 9.9 seconds.

- ↗ Press key P1 to return to the main menu
- ↗ Press key P7 to enable or disable audio ALC (Automatic Level Control)
- ↗ Press key P4 * to set the upper threshold for ALC
- ↗ Press key P2 to reduce the value of the upper threshold
- ↗ Press key P3 to increase the value of the upper threshold
- ↗ Press key P6 to save the changes made
- ↗ Press key P5 * to set the lower threshold for ALC
- ↗ Press key P2 to reduce the value of the lower threshold
- ↗ Press key P3 to increase the value of the lower threshold
- ↗ Press key P6 to save the changes made

(*) Pressing keys P4 or P5 will cycle through the options to modify the threshold measured in KHz, in dB, and the response time of the ALC in seconds.

N.B.

The status of the ALC is displayed by the right hand bar

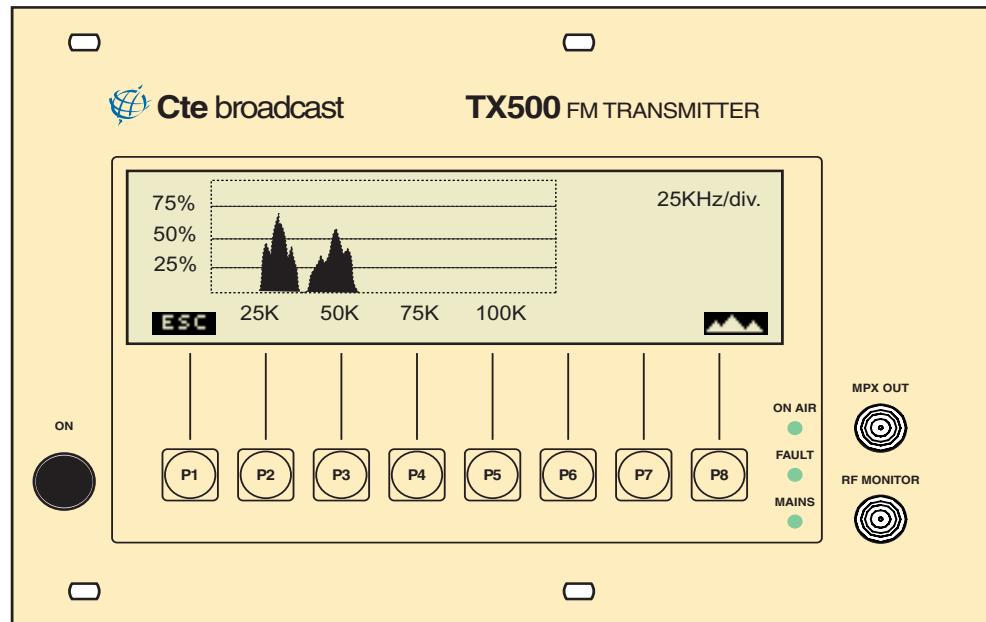

This window shows the absolute value of modulation (MPX) in time.

The graphics allow the modulation to be displayed over a period of several minutes of transmission.

To facilitate reading, the display is calibrated at values of 25, 50 and 75KHz.

3.4.9.
Deviation and
Statistics Menu

- From the deviation menu (previous page)
☞ Press key P8 to display Statistics

- ☞ Press key P1 to return to the main menu
☞ Press key P8 to return to the deviation menu (previous page)

This window displays the percentage modulation (MPX).
The graphics allow evaluation of how much modulation is present and the percentage exceeding 75KHz of modulation.
- Y AXIS: The grid highlights the values 0%, 25%, 75%, 100%
- X AXIS: The grid highlights modulation values 0, 25, 50, 75, 100KHz

3.4.10. RDS Encoder Programming

Each encoder is supplied with a 3.5" disk containing programming software for an IBM compatible PC.

Once installed, the software is already operational - just connect the PC to the encoder and switch it on to start programming it.

At start up a screen will appear asking whether COM1 or COM2 is used for the serial connection. A second screen will then appear, "Baud Rate Selection", which asks for the speed of the serial connection in baud. Select 2400 as the default.

ATTENTION:

In the event that the correct serial port or baud rate has not been selected, the following message will appear:

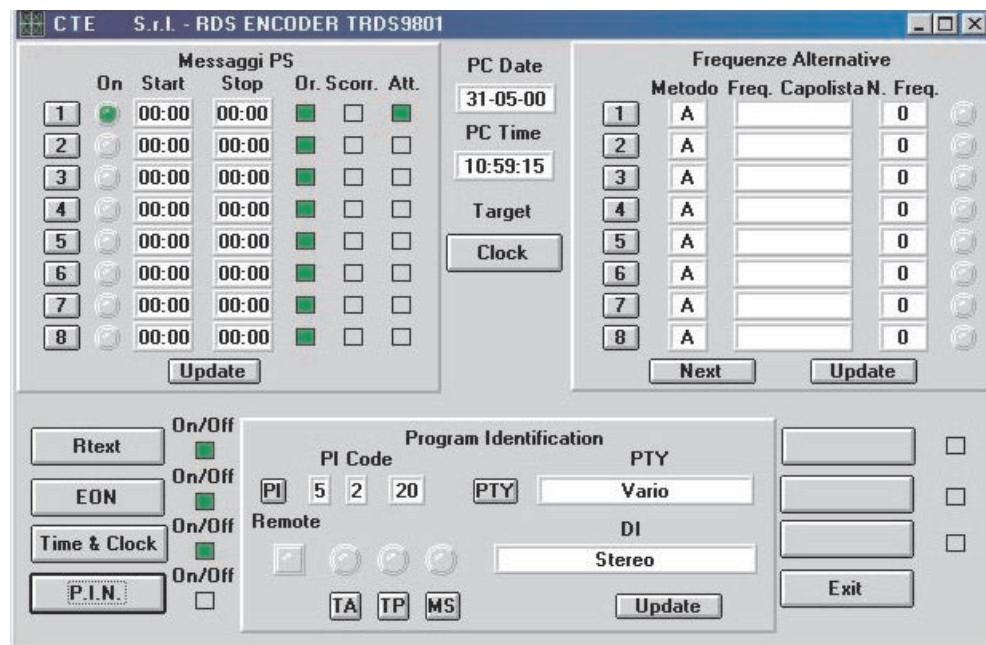

This window will appear whenever an error is detected.

ATTENTION:

Whenever this programme is in use, ensure that you exit any TX500 window that corresponds to RDS programming.

3.4.10. RDS Encoder Programming

Once the port and baud rate have been set, the PC will begin to upload encoder data to determine the data with which it has been programmed. When successfully completed, a screen will appear with three main sections: "PS Messages", "Alternative Frequencies" and "Program Identification".

3.4.10. RDS Encoder Programming

PS Messages:

The "PS Messages" section shows 8 zones, each of which comprises the following fields:

- ✓ 1-8 keys to select the window for modifying the contents of the corresponding PS message.
- ✓ START text box corresponding to the time of start of transmission of the PS message. This field can only be modified if the OR key is lit.
- ✓ STOP text box corresponding to the time of the end of transmission of the PS message. This field can only be modified if the OR key is lit.
- ✓ ATT (active) key enabling the PS message to be transmitted on-air; if green, the message is on-air.
- ✓ OR (time) key enabling the on-air message to be timed; if OR and ATT are both green, the PS message will go on-air between the times specified by the START and STOP fields.
- ✓ SC (scroll) key enabling the transmission of the PS message in scrolling mode (one letter to the right every second).
- ✓ ON indicator (green) confirming that the corresponding message is on-air.

Active messages (ATT lit green) which are not timed (OR grey) will be transmitted consecutively during intervals when timed messages are inactive. To ensure that the video programming is in step with the encoder, press the "Update" key.

Procedure for programming message 1

- ☞ Press OR (time) so that it is lit green (time setting enabled)
- ☞ Click the mouse on the START window
- ☞ Delete the previous time (CANC key)
- ☞ Enter the start time (using the same format:"XX:XX")
- ☞ Click the mouse on the STOP window
- ☞ Delete the previous time (CANC key)
- ☞ Write the end time of the message
- ☞ Press key 1 (the message programming window will appear)

Messaggi PS					
	On	Start	Stop	Or. Scorr.	Att.
1	<input checked="" type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
2	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
3	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
4	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
5	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
6	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
7	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
8	<input type="radio"/>	00:00	00:00	<input type="checkbox"/>	<input type="checkbox"/>
Update					

3.4.10. RDS Encoder Programming

Programming PS Messages

Having pressed one of the keys 1-8, corresponding to the number of the PS message to program, a window will appear with 16 fields for the words which make up the message, and the corresponding times for which the words will be displayed.

The times, in seconds, can be programmed from a minimum of 1 second to a maximum of 60 seconds and represent the time for which the word will be displayed before being replaced by the next word. However, if the message is programmed to scroll (the SC key is lit green in the previous window), the times displayed have no relevance.

N.B.

The fields which are left blank are not transmitted even if a display time of more than one second has been set.

Procedure for programming a message

1. Double click on the text box where a word is to be entered, and then enter the word
2. Adjust the display time of the word using the UP and DOWN arrows underneath the text box
3. Repeat steps 1 and 2 for all the other words to be programmed
4. Press the UPDATE key to save the message and exit from the window

Alternatively, press the EXIT key to exit from the window without saving the message

From the main window:

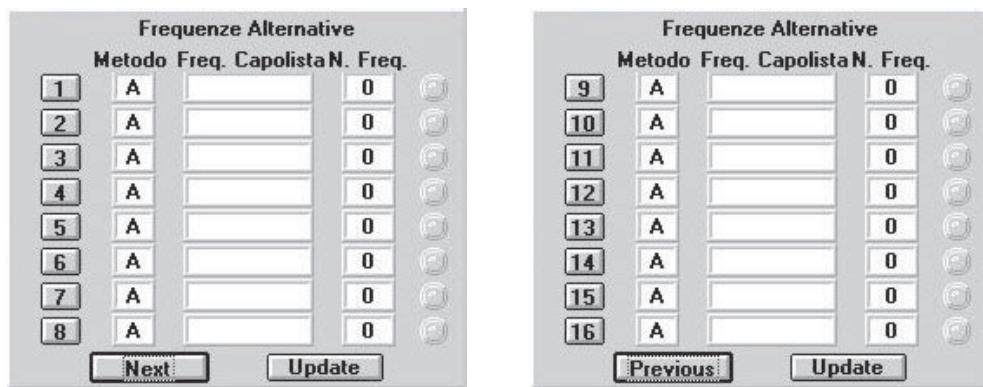

5. Press the ATT key (activate the message)
6. Press the UPDATE key to update (the green ON indicator will light to show the message is active)
7. It is now possible to insert other messages (upto 8) following the same procedure

3.4.10. Alternative frequencies

RDS Encoder Programming

The Alternative frequencies section allows 16 lists of different frequencies to be programmed, each in mode A or B. 8 lists are displayed at a time and with each one, the mode (A or B) with which it was programmed, the header frequency (this field is filled only if mode B has been used) and the number of frequencies in the list. To access a list just click the corresponding key with the mouse; a display will appear showing the mode and the list of possible frequencies on the left, and the frequencies in the list on the right. Double-click on a frequency contained in the left-hand list and it will be added, if not already present, to the list on the right. With mode A, it is possible to create a list with a maximum of 25 frequencies compared with 12 in mode B.

Frequenze Alternative					
Numero	Metodo	Freq.	Capolista	N. Freq.	
1	A			0	<input type="radio"/>
2	A			0	<input type="radio"/>
3	A			0	<input type="radio"/>
4	A			0	<input type="radio"/>

Method A/B

The EBU standard allows for the possibility of transmitting the set of frequencies to a network of transmitters in two modes, A and B.

- Method A allows transmission of one or more lists of frequencies, each upto a maximum of 25.
 - Method B allows transmission of as many lists as there are transmitters in the network
- Each list is headed with the frequency of the transmitter to which it corresponds and contains all the frequencies of adjacent transmitters.

Each receiver is designed to store a certain number of alternative frequencies which will be searched automatically for a new frequency when the current signal is too weak to receive. The search is as fast as the list of alternative frequencies is short. When the number of transmitters exceeds 12, it is advisable to use method B in which the receiver stores only the list corresponding to the header frequency to which it is tuned, so facilitating a faster change of frequency.

3.4.10. RDS Encoder Programming

Programming alternative frequencies

To correctly program alternative frequencies, follow the instructions in sequence:

1. From the main menu, click on the key corresponding to the list to program.
2. Select method A or B.
3. Scroll the list of frequencies and double-click the mouse on the desired frequency. The data will be inserted in the selected list of frequencies (right-hand list). With method B selected, the first selected frequency is the header frequency and appears in the relevant window. To delete any stored frequency, double-click on it with the mouse.
4. To save the selection, click on USCITA.
5. In the main menu a green indicator will appear to the left of the list being modified or programmed to show that data is being changed. Click the UPDATE key to store the new data in the RDS board.

At this point, further alternative frequencies may be programmed.

Esempi

Metodo A

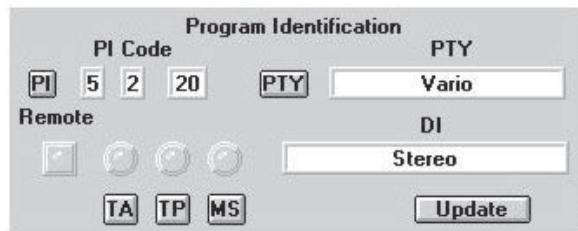

Metodo B

Program identification

In this section parameters specific to the broadcaster are programmed; Program Identification, Program Type, Decoder Identification, Traffic Announcement, Traffic Program and Music/Speech.

3.4.10. RDS Encoder Programming

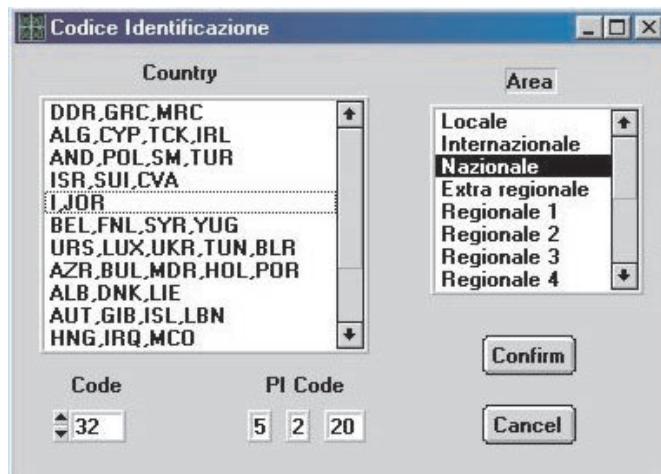

3.4.10.1. Program identification PI

PI is an identification code comprising 3 fields: COUNTRY + DIFFUSIONE + CODE.

COUNTRY is a numerical value from 0 to 15 (0,F in hexadecimal) which identifies the country of the broadcaster (Italy - code 5).

DIFFUSIONE is a numerical value from 0 to 15 (0,F in hexadecimal) which identifies the area of coverage of the broadcast signal (local, regional, national, international).

CODE is a numerical value from 0 to 255 (00,FF in hexadecimal) which identifies the broadcaster; the code is assigned by an authorised organisation.

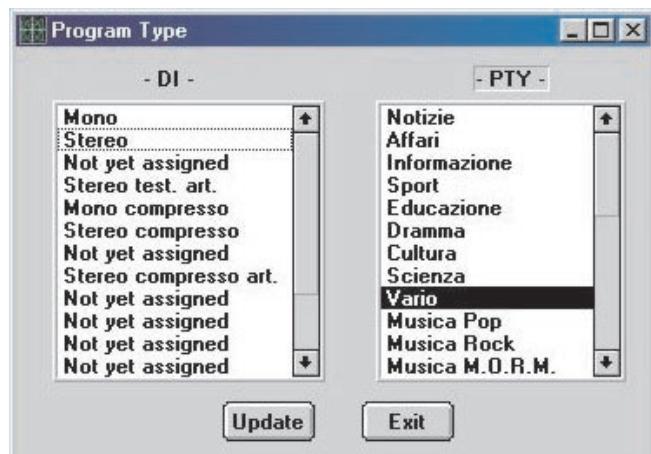

1. To program PI just click on the corresponding key with the mouse.
2. Double-clicking on the item will automatically enable the relevant codes.
3. Press the CONFIRM key to confirm the choice.
4. To exit without saving, press CANCEL

Program Type and Decoder Identification DI

PTY is a code with 32 values (from 0 to 31) which identifies the type of transmission being broadcast.

DI identifies 16 different operational modes that the broadcaster can use.

- Click the PTY key with the mouse to start programming
- To store the selection, press UPDATE.
- To exit without saving, press EXIT.

3.4.10. RDS Encoder Programming

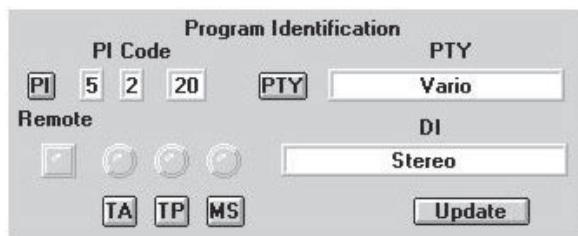

TA-TP-MS

At any time during the day, the broadcaster can interrupt the programme being transmitted with traffic news; for this reason the standard provides for a number of flags which indicate to the receiver that this information is being transmitted so that automatic tuning and/or volume adjustment can be made. These flags are named TA, TP and MS.

- ✓ The TP flag identifies the broadcaster which is making traffic announcements
- ✓ The TA defines the time intervals between traffic announcements.
- ✓ The MS flag indicates whether the transmission is of Music or Speech (Voice)

These flags can be set by clicking the mouse on the relevant keys or via a remote keyboard connected to the appropriate board connector. If the remote keyboard is connected, the "Remote" key will be lit green and setup via a PC will be inhibited.

If the colour of the TA, TP and MS keys do not agree with the encoder leds immediately above, this means that the flags set on the screen do not match those of the encoder. To update them press the Update key.

Radio Text

Radio Text is a message with a maximum length of 64 characters used to check the quality of the signal within the coverage area. The message is transmitted indefinitely.

To program the message, click the mouse on the RTEXT key.
To activate the message, click the mouse on the adjacent ON/OFF key.

3.4.10. RDS Encoder Programming

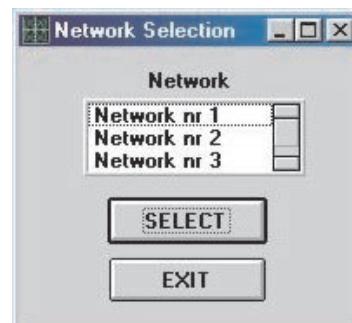

EON Message

The EON message is used when a broadcaster has an agreement with another broadcaster (that we shall call "Friend") to permit automatic tuning of receivers to Radio Friend, in areas where the signal quality of the broadcaster is poor or absent, or when Radio Friend is broadcasting information of interest to the listener.

RDS allows programming of data upto a maximum of 8 partner broadcasters. Each broadcast network is a broadcaster in its own right and must therefore have unique identification of its data and allow all common services of interest identifiable between the two broadcasters.

Programming access to all this data is enabled by clicking the EON key located on the left side of the main panel; this displays the list of 8 networks that can be programmed.

Having chosen a network, a screen is displayed which shows all the parameters to be programmed: PI-PS-TA-TP-PTY-AF-PIN

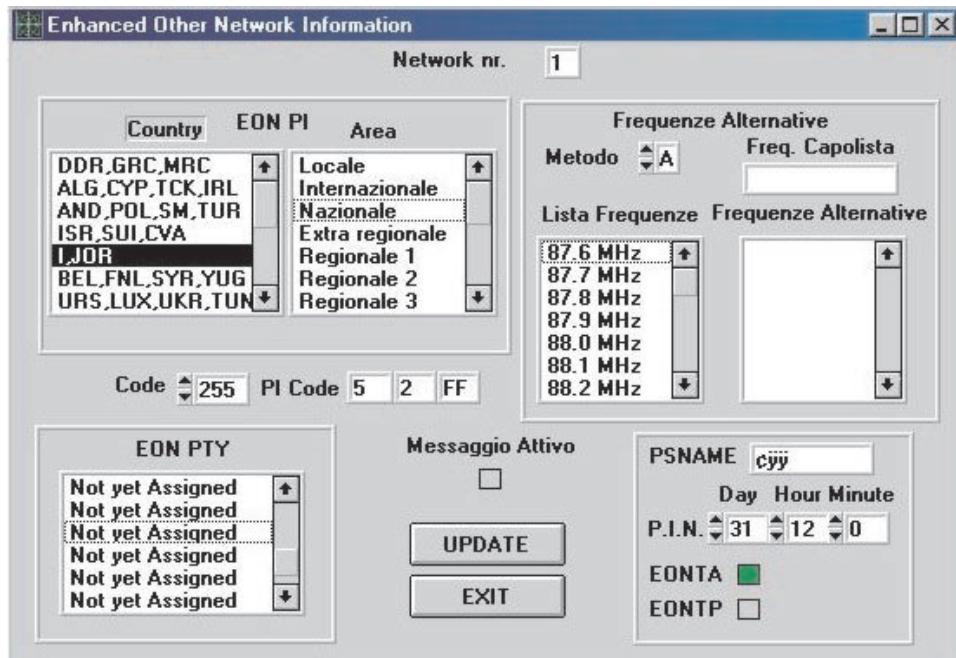

- ✓ PI is the identification code of radio Friend.
- ✓ PS is the 8 character message which is displayed on receivers tuned to the radio Friend frequencies.
- ✓ TP indicates that the Friend broadcaster is enabled to transmit traffic news.
- ✓ TA indicates that the Friend broadcaster is transmitting traffic announcements.
- ✓ PTY indicates the type of programme.
- ✓ AF indicates the list of alternative frequencies on which radio Friend can be received.

3.4.10. RDS Encoder Programming

The method of programming is similar to that of the main broadcaster (see previous pages). For each network it is possible to program a maximum of 7 frequencies with method A and 4 frequencies with method B.

To enable transmission of the programmed data for each network, just press the "Message Active" key; if it is coloured green, this means that the data is valid and may be transmitted.

ATTENTION: data relating to active networks (those for which the "Message Active" is green) are transmitted even if the ON/OFF key on the main panel is set (green).

Time & Clock Data

The RDS encoder has an on-board clock-calendar which provides an autonomous timing function. The clock-calendar can be read and updated so that listener's receivers can be synchronised. When this message is transmitted, the encoder sends a data packet containing the date and time referred to the Greenwich meridian on every change of minute. The time difference is expressed in half-hour steps.

To synchronise the clock-calendar to the actual date and time:

1. Press the CLOCK key or the TIME&C key

PC Date	31-05-00
PC Time	11:07:41
Target	Clock

- 3.4.10. RDS Encoder Programming**
2. Double-click on the TARGET TIME box and enter the time local to where the broadcaster is transmitting.
 3. Double click on the TARGET DATE box and enter the date.
 4. Select the location with respect to Greenwich (the RDS system is able to update the time according to the country in which it is transmitting).
 5. Press the UPDATE key to transfer the data to the encoder.

If the EXIT key is pressed, the clock-calendar will not be changed.

Once the programming is complete, the PC can be disconnected and used for other purposes. Clicking the mouse on the EXIT key will terminate programming of the encoder.

DATA BACKUP	10 years
OPERATING TEMPERATURE...	0 - 55 °C.....
POWER SUPPLY	+12Vdc 100mA, +5Vdc 800mA

3.5. Checking performance

This procedure for checking performance should be carried out if there is any doubt over the integrity of the unit or possible damage sustained during transport. It should be performed by expert personnel capable of operating radiofrequency measurement equipment.

The unit is calibrated using an FMAB modulation analyser (R&S) and so the performance checking equipment must be high precision, analogue instrumentation.

Power developed

Connect a high quality wattmeter (e.g. Bird mod. 43) to the unit, via a double, male N-type connector. The wattmeter output is connected to a high quality dummy load (SWR less than 1.05) capable of dissipating at least 500W continuously via a 50 Ohm coaxial cable of appropriate cross section (e.g. RG213). Adjust the maximum range of the wattmeter to correspond to the power generated (e.g. for a Bird mod. 43 wattmeter, use a 500W probe adjusted to measure direct power). Power up the unit and check that the power shown on the display corresponds to the power displayed by the wattmeter. There is a tolerance of upto 25W difference between the two.

It is of the utmost importance to use a wattmeter that is performing to its high precision specification.

The measurement will be invalid if the wattmeter is connected to the unit via a coaxial cable without the double connector as specified.

Programmed frequency

Connect the unit to a dummy load with a -30dB output capable of dissipating at least 500W of continuous power, via a 50 Ohm coaxial cable of appropriate section (e.g. RG213). Connect the output of the dummy load, attenuated by another 20dB, to a frequency meter which is known to be performing to its high-precision specification. Power up the unit and check that the frequency shown on the display corresponds to the frequency displayed by the frequency meter. There is a tolerance of upto 100Hz difference between the two readings.

Deviation

Connect the unit to a dummy load with a -30dB output capable of dissipating at least 500W of continuous power, with a coaxial cable of appropriate section (e.g. RG213). Connect the output of the dummy load, attenuated by another 20dB to a modulation analyser which is known to be performing to its high-precision specification. Connect the MPX input to a 1KHz sinusoidal signal from a low-frequency signal generator, with the amplitude adjusted for a level of 0dBm. Power up the unit and check that the deviation displayed by the unit and by the modulation analyser fall within the range 75KHz -0.2dB and 75 KHz.

4.1. Introduction

This technical manual contains information regarding the operation, use and maintenance of the TX500 exciter.

The TX500 operates in the frequency band from 87.5MHz to 108MHz in steps of 10KHz and is capable of developing a maximum, continuous power of 500W.

All the operating controls of the unit are directly accessible from the front panel whilst all the connectors are available on the rear panel.

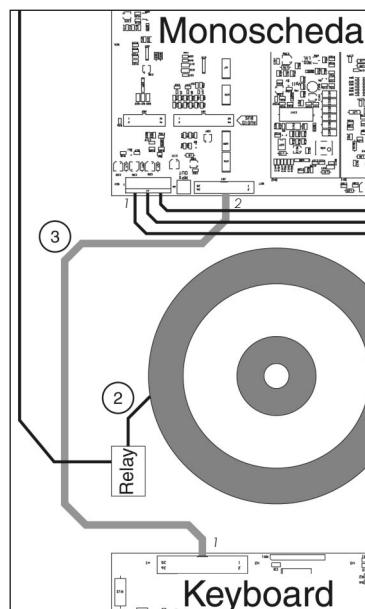

The connectors for measurement of signals are however located on the front panel.

The exciter can be used for monophonic, stereo and composite multiplex transmissions.

4.2. Using the block diagram

The block diagram describing TX500 exciter is on the following page.

The principle of communication between the various boards is clear from their interconnection; each connection is identified by a progressive number within a circle. In the pages following the block diagram where individual boards are described, the cable loom numbers are identified in order to simplify maintenance and eventual repair.

In this case, for example, the board is connected to the keyboard via flat 3, and the transformer is connected to the relay via cable 2 etc.

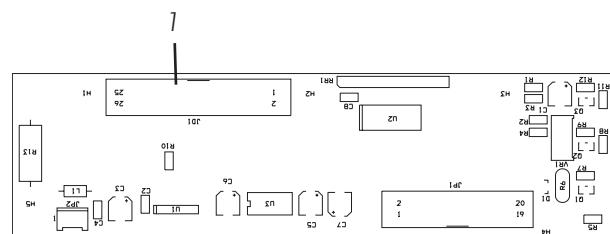

In the board descriptions following the block diagram, the following information appears:

Connections:

- 1 (JD1) via cable flat 3 to 1 (J1) of the monoboard

The first number is a reference whilst the number in brackets represents the name of the connector of the board in question.

For more detail, see the layouts of the schematics.

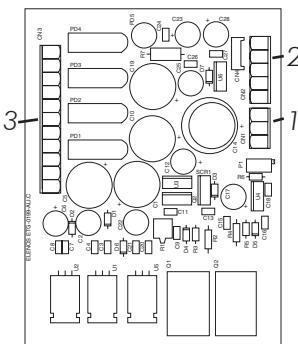

Pag 1 file A3

4.4. Power supply section

The TX500 uses a switch-mode power supply connected direct to the line supply. The TX500 exciter features a line filter fitted to the alternating supply to provide maximum suppression of conducted interference. The use of discrete component technology enables easy replacement in the event of failure.

4.4.1. Service power supply

The service (or auxiliary) power supply furnishes 5 separate supplies which supply the various boards which go to make up the unit.

The table below summarises the supply voltages for each section of the unit and the corresponding protection.

The service (or auxiliary) power supply is a linear type in order to reduce to a minimum any disturbances that could interfere with the boards.

Supply Voltage	Boards supplied	Protection
+12V	Mother board (CPU, PLL, BUS)	Current protection
-12V	Mother board (CPU, PLL, BUS)	Current protection
+5V	Mother board (CPU, PLL, BUS)	Current and voltage protection
+12V _{RF}	RF driver stage	Current protection
+18V _{RF}	RF driver stage	Current protection

Connections:

- 1 (CN1) via cable 13 to 2 to the "DRIVER" board
- 2 (CN2) via cable 4 to 1 (J1) of the mother board
- 3 (CN3) via cable 7 to the transformer

4.4.2. Switch-mode power supply

Supplies a variable voltage from +30V to +50V, with current and voltage protection. It uses a mix of SMD and traditional technology to reduce the space occupied as far as possible.

The power supply features thermal protection and a further line filter equipped with VDRs on the input.

Connections:

- 1 via cable 2 to the relay
- 2 via cable 5 to 1 (J1) of the mother board
- 3 via cable 18 to 3 of the RF modules

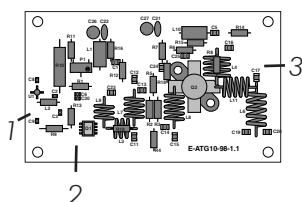

4.5. Radiofrequency section

This comprises a low power output stage (driver) which, via a splitter, supplies the power to the two final power stages.

The power output from the modules supplies a coupler (or output combiner) which concentrates all the power to the input of the low-pass filter.

The measurement probe which is located on the final part of the low-pass filter, reads the values of direct and reflected power for the CPU.

4.5.1. Driver

The driver comprises an input stage of about 10mW and supplies a maximum output power of 15W.

It is built using a mix of technologies and subdivided into three main amplifying stages.

The first stage is a "MMIC" type "ERA5".

The second stage is a MOS BLF404.

The third stage is a MOS BLF244.

The output of the driver is connected to the input splitter.

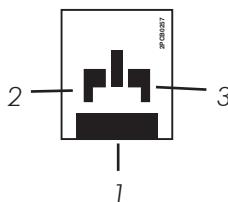

Connections:

- 1 via coaxial cable 10 to 3 (J8 RF OUT) of the mother board
- 2 via cable 13 to 1 (CN1) of the services power supply (auxiliary)
- 3 via coaxial cable 14 to 1 of the input splitter (Splitter IN)

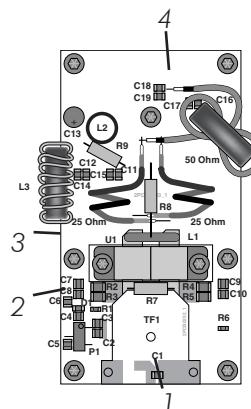

4.5.2. Input splitter

Connections:

- 1 via coaxial cable 14 to 3 of the DRIVER
- 2 via coaxial cable 15 to 1 of the first RF final stage
- 3 via coaxial cable 16 to 1 of the second RF final stage

4.5.3. RF Modules

The two modules comprise a MOSFET (BLF278) and are capable of delivering a maximum power of 300W each.

The gates are controlled by the CPU so that power output can be inhibited when the user changes frequency.

The outputs of both modules enter the coupler (or output combiner).

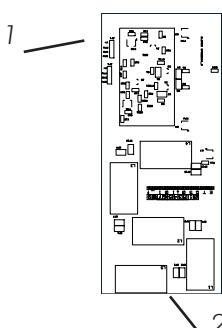

Connections:

- 1 via coaxial cables 15 and 16 to 2 and 3 of the input splitter (Splitter IN)
- 2 via cable 6 to 1 (J1) of the mother board
- 3 via cable 18 to 2 of the power supply
- 4 via coaxial cable 17 to 2 of the low-pass filter (LPF INPUT)

4.5.4. Output combiner

This comprises two RG302, 75 Ohm coaxial cables (cable 17) connected in parallel by the sleeves and central conductor on the low-pass filter, each soldered to the two RF modules (4).

4.5.5. Low-pass filter RF Out

This is a ninth order "CHEBYCHEV" filter, with teflon support. It guarantees the suppression of harmonic components with the limits set by International standards.

Connections:

- 1 (JP1) via flat cable to 5 (CN1) of the mother board
- 2 via coaxial cable 17 to 4 of the RF Modules

"RF Out" indicates the RF power output connector which is located on the rear panel

4.5.6.1. Directional coupler

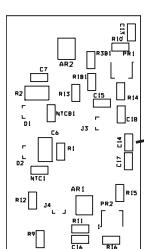

The directional coupler is located on the final output stage of the low-pass filter. It is designed using SMD technology and is shielded to prevent RF interference. It generates a voltage proportional to the direct and reflected power.

Connections:

- 1 (JP1) via flat cable 11 to 5 (CN1) of the mother board

N.B.

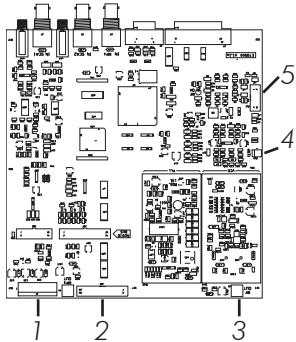

The directional coupler is mounted on the same circuit board.

4.5.6.2. Directional coupler AGC protection

A control circuit regulates the output power and maintains it to within +0.1dB across the whole operating band, progressively reducing it down to 50W in the event of excessive SWR. This enables the exciter to continue to work with infinite SWR at any phase angle.

4.6. Logic (Mother board)

This board is constructed using only SMD technology and comprises the following stages:

- CPU
- AGC
- VCO/PLL
- MPX

Connections:

- 1 (J1) via cable 4 to 2 (CN2) of the services (auxiliary) power supply
- 1 (J1) via cable 5 to 1 of the power supply
- 1 (J1) via cable 6 to 2 of the RF Modules
- 2 (JD1) via cable flat to 1 (JD1) of the Keyboard
- 3 (SC1) via coaxial cable 10 to 1 of the Driver
- 4 (CN2) via cable 12 to the temperature sensor
- 5 (CN1) via cable flat 11 to 1 of the directional coupler

4.6.1. CPU

The CPU controls the display, the keyboard, ALC and the VCO/PLL. It comprises an 80C552 microprocessor which operates at a clock rate of 16MHz.

It features a 256 Kbit RAM and a 2Mbit ROM.

It receives input signals from the directional coupler and supplies processed signals to the ALC.

It also controls all the audio functions.

4.6.2. ALC

This receives signals from the CPU and supplies 2 output voltages:

- 1) Controls the MOS gates
- 2) Controls the output voltage of the power supply.

It features SWR protection which limits the output power in the event of an SWR in excess of the programmed threshold.

4.6.3. VCO/PLL

The PLL board generates the frequency-modulated RF signal using phase-lock synthesis.

The oscillator, controlled by the VCO voltage and mounted next to the PLL board, uses very low-noise components and also separation stages to obtain very low phase noise.

The reference frequency is generated by a temperature-compensated oscillator with a maximum drift of 1ppm.

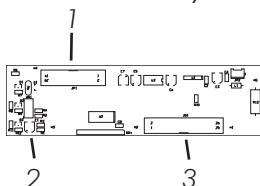

4.6.4. MPX

Accepts the wide-band MPX input signal, i.e. it supplies the transmitter with a stereo signal derived from an external stereo encoder. It features 2 SCA inputs, one of which can be used as an RDS data input.

The two unbalanced inputs for SCA signals accept input frequencies upto 200 KHz. The MPX also supplies the microcontroller with an appropriately processed MPX signal so that the level can be displayed as a bar graph and in dBV values. The inputs are protected against over-voltage.

The inputs are unbalanced on BNC connectors (impedance 10KOhm).

4.7. Keyboard

This is interfaced to the CPU and supplies signals to the display as well as power for illumination.

A trimmer allows adjustment of the contrast.

8 soft keys perform functions shown on the display.

Connections:

- 1 (JP1) via flat cable 3 to 2 (JD1) of the mother board
- 2 via cable 8 to the display
- 3 (JD1) via flat cable 9 to the display

4.8. Optional boards

The optional boards offer extra facilities required by customers and are simply fitted by inserting them into the relevant slots, described on par. 1.2. of this manual, with the unit switched off.

4.8.1. Stereo Input Board (TX500S version only)

This board comprises two modules:

- Inputs
- Clipper

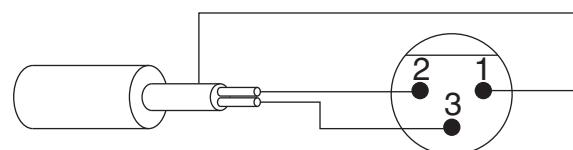

Inserted into the slot indicated in par. 1.2., it has the function of processing the audio signal for stereophonic transmission. The board also supplies the processed stereo signal to the microcontroller which displays stereo levels using a bar graph and values expressed in dBu. The input connectors are balanced, XLR type (see the connection diagram below).

Adjustments:

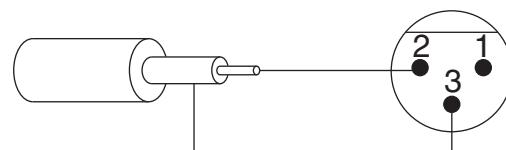

- ☒ selection (jumper) of the value of pre-emphasis (50/75 usec)
- ☒ ON/OFF (jumper) of pre-emphasis
- ☒ ON/OFF (software) of pre-emphasis, of the clipper and of the filter
- ☒ adjustment (software) of the level in steps of 0.5dB on each channel
- ☒ selection (jumper) of the input impedance value (600Ohm/10KOhm)

Balanced line

Pin1: earth
 Pin2: positive
 Pin3: inverter

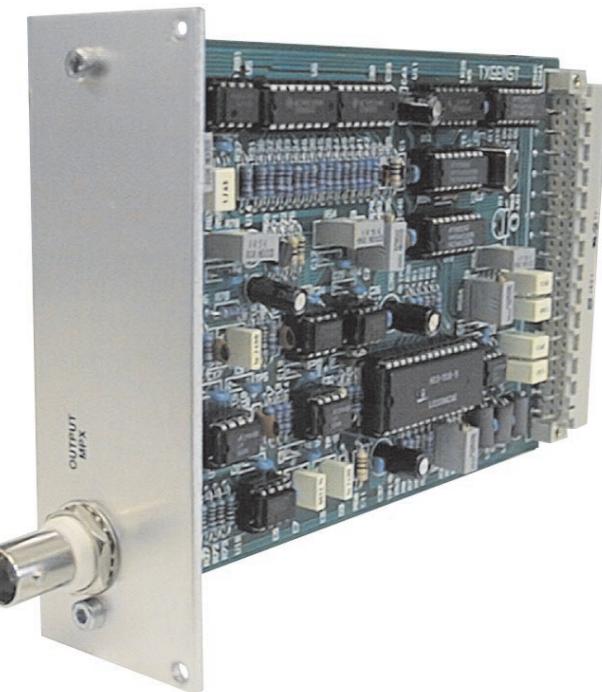

Unbalanced line

4.8.2.
*Stereo Encoder Board
(TX500S version only)*

This board digitally generates the 19 KHz pilot carrier and the suppressed carrier. It fits in the slot indicated in par. 1.2.

It features a BNC connector for supplying the signal to other transmitters.

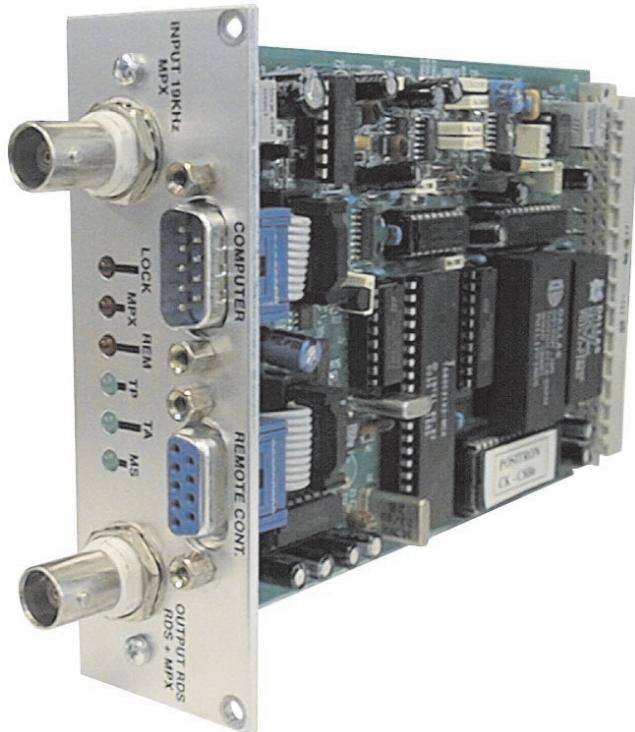

Adjustments:

- ☒ adjustment (trimmer) of the pilot tone (8-12%)
- ☒ adjustment (trimmer) of the MPX signal clipper threshold before being added to the pilot carrier
- ☒ ON/OFF (jumper) of the clipper
- ☒ adjustment (trimmer) of the MPX level on the output of the board
- ☒ adjustment (trimmer) of the phase of the pilot tone with respect to the suppressed carrier
- ☒ adjustment (2 trimmers) of the equaliser of the sum of the signals (L+R) to obtain maximum separation
- ☒ adjustment (trimmer) of the suppressed carrier level (greater than 90 dB)
- ☒ ON/OFF (software) of the clipper
- ☒ ON/OFF (software) of the pilot carrier
- ☒ selection (software) stereo/mono

Technical data

PRE-EMPHASIS	50/75 us +/-0.1dB
FREQUENCY RESPONSE	+/-0.15dB (30Hz - 15KHz)
STEREO SEPARATION	typically 65dB @ 1KHz
PILOT TONE	Frequency: 19KHz +/- 1Hz deviation 7.5KHz adjustable
AUDIO INPUT MODULE L/R	Input impedance: 10KOhm - 600Ohm (selectable) balanced input Frequency response: 20Hz - 15KHz Adjustment: -12 - +12dB in steps of 0.1dB Connector: XLR female
ATTENUATION AT 19KHz	45dB

4.8.3. RDS Board

Introduction

For several years now, within the field of radio broadcasting, the importance of transmitting data packets of various types, over and above the radio signal, has been recognised as crucial to improving the quality and reliability of the services offered, let alone implementing new ones.

This need was acknowledged at international level and a study group was given a mandate to identify the various needs and define a transmission standard which is suitable for the sector.

The group created the RADIO DATA SYSTEM (RDS) which is now the most diffuse system of data transmission in the radiophonic sector.

The optional RDS board fits in the slot indicated in par. 1.2. of this technical manual.

The TX500's optional RDS board allows a data channel to be transmitted alongside the radiophonic signal (mono or stereo), in conformity with the "Specification of the radio data system (RDS)" document, published by the European Committee for Electrotechnical Standardization (CENELEC) Ref. NO. EN50067:1990.

RDS system

The RADIO-DATA-SYSTEM (RDS) has been specified for the transmission of information within mono/stereophonic programmes in the VHF/MF (87.5-108MHz) band, thus satisfying the requirements for transmission of additional data in radiophonic programmes.

- > Compatibility with actual mono/stereophonic programmes
- > Absence of interreference between adjacent channels
- > Compatibility with other existing systems of identification

4.8.3. RDS board

The system, selected by an international working group of specialists, allows data transmission at a speed of 1187.5 bit/sec with phase modulation at two levels, 57KHz carrier and band +/- 2KHz. The transmitted binary signal undergoes differential encoding.

The transmission protocol comprises packets of 104 bit (87.6ms) length, named GROUPS, each comprising 4 BLOCKS of 26 bits each. Each BLOCK is made up of 16 bits of information and 10 protection bits, designed specifically to allow words to be corrected upto a maximum of 5 bit in error. 16 distinct GROUPS are provided, some of which have not yet been defined. Each group starts with an identification code (PI) which has the double scope of synchronising the receiver and identifying the broadcaster that is transmitting the signal. The PI comprises a 4 bit code to identify the country (Italy is code 5), a 4 bit code to define the coverage of the transmitted signal (International, National, Sub-National, Regional or Local) and an 8 bit code for the number of reference of the program.

The Zero GROUP is used for sending the PS message (shown on the display of RDS compatible receivers) and for tuning frequencies. Each Zero group contains 2 characters of the message, two tuning frequencies, a code which defines the type of transmission (mono, stereo, compressed, etc.), a bit to define whether music or speech is being transmitted and a code for signalling the transmission of traffic news.

Two formats are provided for the transmission of alternative frequencies:

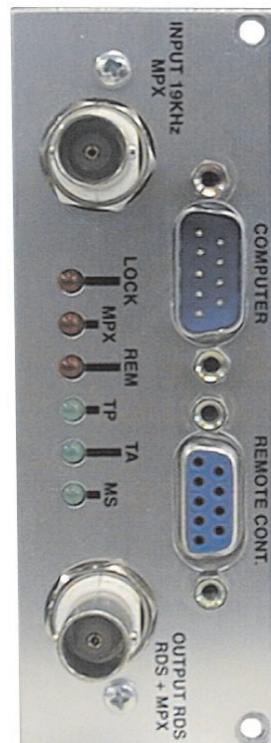

A) Each station transmits a unique list of frequencies, preceded by the number of frequencies that it contains (max 25);

B) Each station transmits a unique list of frequencies for each transmitter that it possesses. The list begins with the header frequency, followed by the frequencies (max 12) used by adjacent transmitters in the coverage area. This method is more efficient when the list of frequencies is long because it presents the self-tuning system with fewer frequencies to choose from and thus speed up the process of searching for new frequencies. If the number of frequencies is low, mode A is advised as it requires less data to be transmitted.

RDS system

The RDS encoder comprises a single Euro card offering the following features:

- ✓ Connector 41612 which accepts the power supply voltages +5V and +12V
- ✓ BNC for the input of the mono or stereo signal
- ✓ BNC for the output of the MPX signal and/or MPX+RDS
- ✓ Cannon connector 9 PIN for serial connection to a PC
- ✓ Cannon connector 9 PIN for connection of a remote keyboard
- ✓ A panel-mounted trimmer for adjusting the RDS signal level
- ✓ Led indicator, for lock and carrier generation RDS (LOCK)
- ✓ Led indicator, for synchronisation with stereo carrier (STEREO)
- ✓ Led indicator for remote control active (REM)
- ✓ Led indicator for TP set (TP)
- ✓ Led indicator for TA set (TA)
- ✓ Led indicator for MS set (MS)

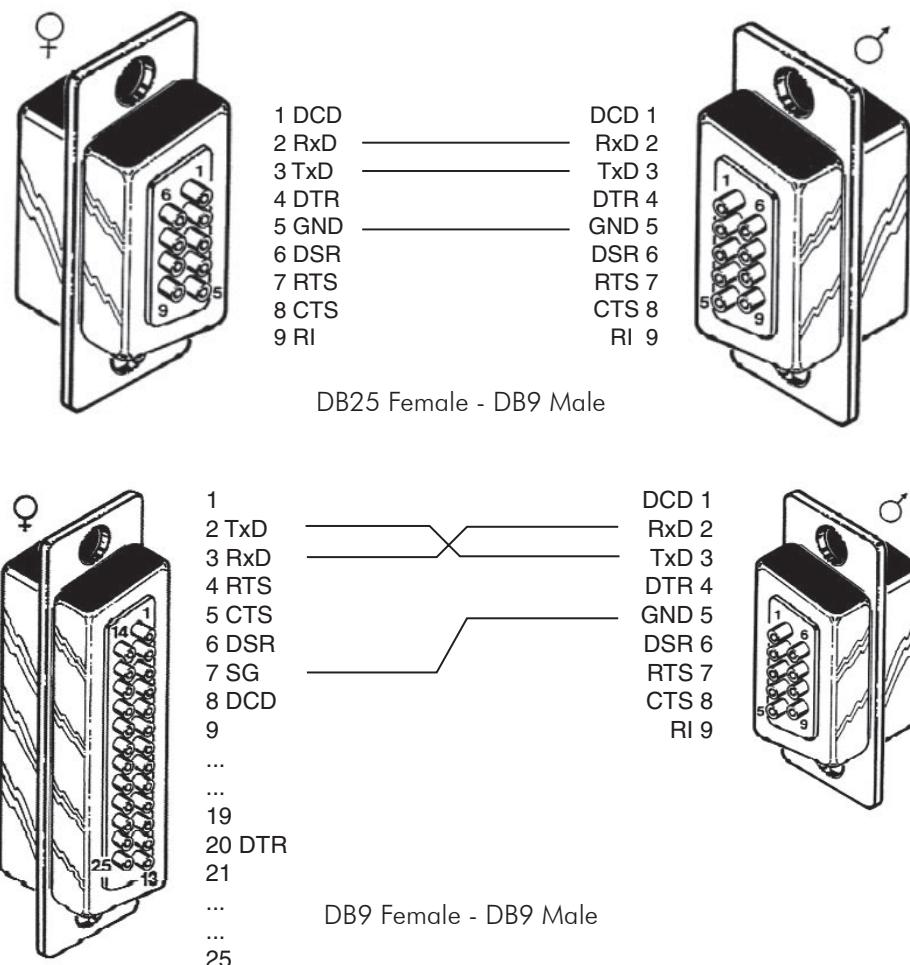

4.8.3. RDS board

The board is equipped with DB25-type female to DB9-type male cable, which can be replaced by a DB9 female to DB9 male cable (see diagram below), plus a 3.5" floppy with software for correctly programming the RDS.

N.B.

The software supplied is Microsoft Windows (c) compatible.

The board features a microcontroller which controls the RDS message generation.

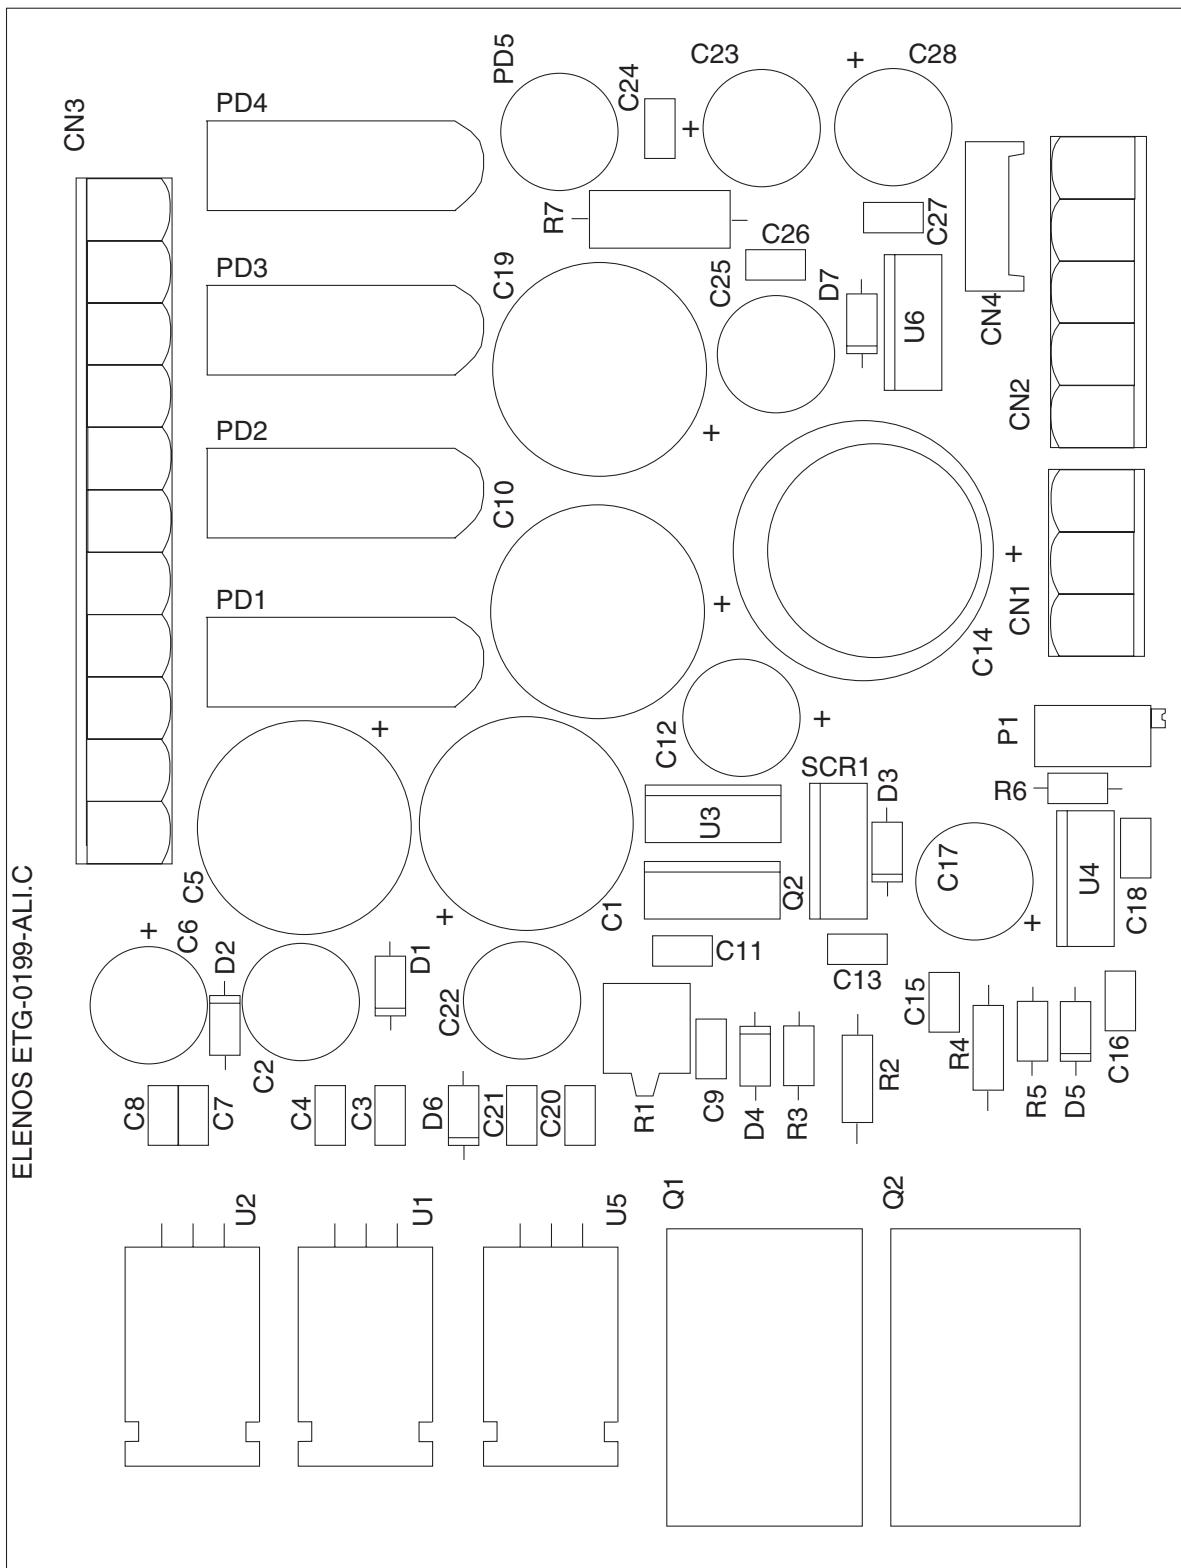

The services supported by the encoder are programmed via a PC connected to the serial interface, running an easy-to-use program. Once programmed, the RDS messages are saved, even in the absence of primary power.

The board is equipped with a timer-calendar which updates the date and time even when no external power is present.

The RDS carrier is generated internally by a quartz oscillator, but when a 19KHz carrier is applied to the MPX1 IN input, whose amplitude, stability and frequency conform with the specification, the encoder locks to the external frequency and generates the 57 KHz synchronised to it (STEREO led lit). Thanks to the microcontroller, the encoder can modify the transmitted message in real time which makes the system extremely flexible and adaptable to the various customer requirements.

The software supplied allows programming of a set of 8 distinct PS Messages each comprising 16 words of 8 characters and a maximum of 16 lists of alternative frequencies. These limits are not binding but have been advised by a sample of users.

- 4.8.3.
RDS board The set of messages can be put on-air automatically at any hour of the day.
 Programming of the messages is very quick and easy; an entire message can be
 programmed in one minute. No special knowledge is necessary on the part of the user.

	C86	10uF Cond elettrolitico SMT Case C
	C87	10uF Cond elettrolitico SMT Case C
	C88	10uF Cond elettrolitico SMT Case C
	C89	10uF Cond elettrolitico SMT Case C
	C65	68pF Cond. ceramico SMT 0805
	C66	68pF Cond. ceramico SMT 0805
	C70	68pF Cond. ceramico SMT 0805
	C71	68pF Cond. ceramico SMT 0805
	C81	470nF Cond elettrolitico SMT Case B
	C82	10uF/25V Cond elettrolitico SMT Case C
	C90	10uF/25V Cond elettrolitico SMT Case C
	C93	4.7uF Cond. elettrolitico SMT Case B
	C94	100pF Cond. ceramico SMT 0805
	C100	100pF Cond. ceramico SMT 0805
	C107	100pF Cond. ceramico SMT 0805
	C101	10pF Cond. ceramico SMT 0805
	C102	10pF Cond. ceramico SMT 0805
	C114	10pF Cond. ceramico SMT 0805
	C112	2.2nF Cond. poliestere SMT
	C103	2.2nF Cond. poliestere SMT
	C110	10nF Cond. poliestere SMT
	C111	47uF Cond. tantalio SMT Case 3528
	C115	220nF Cond. poliestere SMT
	C119	4,7uF Cond. tantalio SMT Case 3528
	C126	4,7uF Cond. tantalio SMT Case 3528
	C120	10uF Cond. tantalio SMT Case 3528
	C123	10uF NP Cond. elettrolitico SMT Case C
	C129	100uF Cond. tantalio SMT Case 7343
	C130	100uF Cond. tantalio SMT Case 7343
	C132	100uF Cond. tantalio SMT Case 7343
	C133	100uF Cond. tantalio SMT Case 7343
	C134	100uF Cond. tantalio SMT Case 7343
	C131	47uF Cond. tantalio SMT Case 7343
	C136	22uF Cond. elettrolitico SMT Case C
	C137	10nF Cond. ceramico SMT 0805
	C141	1500uF Cond elettolitico Vert. 6,3V
	C142	68uF Cond. tantalio SMT Case 7343
	C143	47nF Cond. ceramico SMT 0805 (NON MONTARE)
	C145	220pF Cond. ceramico SMT 0805
	C146	100nF Cond. ceramico SMT 0805 (NON MONTARE)
	C148	470uF Cond. elettrolitico passo 5,08
	C154	27pF Cond. ceramico SMT 0805
	C156	47uF Cond. elettrolitico SMT Case D
	C159	4.7pF Cond. ceramico SMT 0805
	C160	33uF Cond. elettrolitico SMT Case C

TROUBLESHOOTING GUIDE

Problem	Cause	Solution
✓ The unit will not power up	<ul style="list-style-type: none"> ✓ Power cable missing or faulty ✓ Power supply fuses (rear panel) blown ✓ Auxiliary power supply faulty ("MAIN" front panel led not lit) 	<ul style="list-style-type: none"> ✓ Connect or replace power cable and try again ✓ Replace the fuses and try again ✓ Contact the manufacturer
✓ The unit does not reach required power level	<ul style="list-style-type: none"> ✓ Unit in Stand-By ✓ Antenna or amplifier not connected ✓ PLL unlocked ("ON Air" front panel indicator not lit) ✓ Power supply or RF module faulty 	<ul style="list-style-type: none"> ✓ Access the RF menu and enable "RF On" ✓ Connect the antenna or amplifier (check the integrity of the connection) ✓ Contact the manufacturer ✓ Contact the manufacturer
✓ The unit transmits on the wrong frequency	✓ PLL board faulty	✓ Contact the manufacturer
✓ Absence of modulation on the output and on the display	<ul style="list-style-type: none"> ✓ Missing or faulty audio cable ✓ MPX board faulty ✓ Modulation switched off 	<ul style="list-style-type: none"> ✓ Connect or replace the audio cable ✓ Contact the manufacturer ✓ Enable modulation from the audio menu
✓ Absence of modulation on the output but not on the display	✓ MPX board faulty	✓ Contact the manufacturer
✓ Modulation does not reach the required value	<ul style="list-style-type: none"> ✓ Low audio input level ✓ MPX board faulty ✓ ALC threshold programming error 	<ul style="list-style-type: none"> ✓ Increase the audio input level ✓ Contact the manufacturer ✓ Set the correct threshold
✓ Absence of stereo modulation	<ul style="list-style-type: none"> ✓ Stereo carrier disabled ✓ Missing or damaged audio cable ✓ Stereo board faulty ✓ Missing stereo board and/or stereo encoder 	<ul style="list-style-type: none"> ✓ Enable stereo carrier from the user setup menu ✓ Connect or replace the audio cable ✓ Contact the manufacturer ✓ Insert stereo board and/or stereo encoder
✓ Absence of RDS transmission	<ul style="list-style-type: none"> ✓ RDS switched off ✓ RDS message programming error ✓ RDS board missing 	<ul style="list-style-type: none"> ✓ Switch on RDS from the user setup menu ✓ Reprogram RDS board ✓ Insert RDS board

Parameter	Values
FREQUENCY BAND	87.5 - 108.0 MHz in steps of 10KHz
OUTPUT POWER	0 - 500 Watt continuously adjustable
OUTPUT POWER STABILITY	between +/- 0.1 dB
FINAL STAGE TECHNOLOGY	MOSFET
OUTPUT IMPEDANCE	50 Ohm
OUTPUT CONNECTOR	Standard type "N" Female
HARMONIC SUPPRESSION	> 70 dB
SPURIOUS SIGNAL SUPPRESSION	> 80 dB
FREQUENCY STABILITY	Better than 1ppm: (0 - +40°C) in the first year
TYPE OF MODULATION	F3 Direct FM Modulation on RF oscillator at fundamental frequency
RESIDUAL AM	Asynchronous: 0.1% Synchronous: 0.2% (typical values)

Low frequency section

Parameter	Values
V.S.W.R. PROTECTION	Progressively reduced to a safety level (50W)
AUTOMATIC GAIN CONTROL	Stabilises the output power to the level programmed
INTERMODULATION DISTORTION	<0.05% measured with composite tones 1KHz and 1.3KHz, 1:1 ratio at 100% modulation
FREQUENCY DEVIATION	+/- 75KHz adjustable in steps of 0.1dB
THD+N	<0.03% @ 1 KHz
FM S/N RATIO with weighted CCIR filter	-72dB ref. at +/-75KHz dev.
PRE-EMPHASIS	50/75 us +/-0.1dB
FREQUENCY RESPONSE	Mono: +/-0.15dB (30Hz - 15KHz) MPX: +/-0.1dB (30Hz - 100KHz) -45dB at 19KHz Stereo: +/-0.15dB (30Hz - 15KHz) SCA1,2,3: +/-1dB (20KHz - 100KHz) -45dB at 19KHz
STEREO SEPARATION	65dB @ 1KHz typical value
PILOT TONE	Frequency: 19KHz +/- 1Hz deviation 7.5KHz adjustable
INPUT MODULE AUDIO L/R	Input Impedance: 10KOhm - 600Ohm (selectable) balanced i/p Frequency response: 20Hz - 15KHz Adjustment: -12 - +12dB in steps of 0.1dB Connector: XLR female
ATTENUATION AT 19KHz	45dB
MPX INPUT MODULE	Impedance 10KOhm unbalanced i/p Frequency response: 30Hz - 100KHz Adjustment: -12 - +12dB in steps of 0.1dB Connector: BNC female
SCA INPUT	Impedance 10KOhm unbalanced i/p Frequency response: 20KHz - 100KHz Connector: BNC female

General characteristics

Parameter

AMBIENT CONDITIONS

Value

Temperature:
(operating): 0- +45°C
(non operating): -20 - +50°C

Humidity
(operating): 95% at 40°C
(non operating): 90% at 65°C

Altitude:
(operating): >4600 metres
(non operating): >15000 metres

Parameter

Value

WEIGHT

20Kg switch-mode version
30Kg transformer version

DIMENSIONS

50x14x50 cm

POWER SUPPLY

110-240V

POWER CONSUMPTION

800W typical at maximum power output

COOLING

Forced ventilation

Limitations on cable lengths

RS232

connection cable less than 1m.

MPX

connection cable less than 1m.

SCA1

connection cable less than 1m.

SCA2

connection cable less than 1m.

Power supply cable

length less than 3 m.
